The University of Toronto
Chemical Library

Presented
to
The University of Toronto Library
by
William Lash Miller, B.A., Ph.D., C.B.E.
Professor Emeritus of Physical Chemistry
for
A Departmental Library to be under
the control of the Professor of
Chemistry according to the conditions
set out in a letter from the Librarian
of the University dated March 21st
1938.

The Society of Chemical Industry.

LIST OF PAPERS PRESENTED TO THE SOCIETY AND PUBLISHED IN THE JOURNAL DURING 1914.

N.B.—The words within ( ) indicate the Section of the Society (if any) before which the paper was read and the issue of the Journal in which it appears.

PAGE

Acton, A. J. *See* Cohoe, W. P. 947

Ardern, E., and W. T. Lockett. Experiments on the oxidation of sewage without the aid of filters. (Manchester, May 30 and Dec. 15) 523, 1122

Baker, A., and J. Jennison. The bleaching of chemical pulp and suggestions for a standard method. (London, March 31) 284

Barritt, N. W. The coagulation of the latex of *Hevea brasiliensis*, and its bearing on the strength of rubber. (Manchester, March 31) 289

Beadle, C., and H. P. Stevens. Apparatus for drying paper for test purposes. (London, July 31) 730

Bleaching efficiency considered in connection with suggested standards for testing bleaching qualities of chemical wood pulp. (London, July 31) 727

Beckett, E. G. Determination of nitrogen in guncotton by means of the nitrometer. (Scottish, June 30) 628

Bennett, H. G. Analysis of tanning materials. (Yorkshire, Dec. 31):

I. Improved basic chloride shake method.. 1182

II. Tannery liquors 1184

Note on the tannins of valonia, oak wood, and chestnut wood. (Yorkshire, Dec. 31).... 1186

Bland, N., and L. L. Lloyd. Estimation of aldoses. Action of neutral sodium hypoiodite. (Yorkshire, Oct. 15) 948

Browning, K. C., and C. T. Symons. Alcohol estimation in the tropics. (Aug. 31) 819

Budde, C. Extraction apparatus, specially designed for solvents of high specific gravity. (Newcastle, Feb. 28) 184

Carter, F. G. The method by which the corrected Sikes's tables in use in India for determining the proof strengths of spirits at temperatures from 40°—100° F., were calculated. (Oct. 31) 993

Chandler, C. F. The invention of celluloid. (New York, March 16 and July 15) 225, 677

Clifford, J. *See* Fowler, G. J. 815

Cobb, J. W., and G. Dougill. Corrosion by dissolved oxygen. (Yorkshire, April 30) 403

Cohoe, W. P., E. C. Fox, and A. J. Acton. Viscose as a casing for sausages. (Canadian, Oct. 15) 947

Collins, S. H., and A. A. Hall. The use of coal tar creosote and naphthalene for preserving wooden fences. (Newcastle, May 15).... 466

Coombs, F. A., and A. H. Dettmann. Notes on Australian pine barks. (Sydney, March 16) 232

Crookes, Sir W. Presidential address. (July 31).. 720

Davies, E. L. Hysteresis tests for rubber. (Oct. 31) 992

PAGE

Davis, W. C. Estimation of naphthalene in spent oxide. (Birmingham, Dec. 15) 1120

Dettmann, A. H. *See* Coombs, F. A. 232

Dougill, G. *See* Cobb, J. W. 403

Egerton, A. C. The heat test of explosives. (London, Feb. 16) 112

Fawsitt, C. E., and C. W. R. Powell. The action of concentrated sulphuric acid on iron. (Sydney, March 16) 234

Forstall, A. E. Recent improvements in gas manufacture. (New York, April 30) 398

Fowler, G. J., and J. Clifford. Notes on the composition of sundry residual products from sewage. (Manchester, Aug. 31) 815

Fox, E. C. *See* Cohoe, W. P. 947

Gaunt, R. The viscosity of rubber solutions. (London, May 15) 446

Girvin, H. G. The use of dry air in the blast furnace. (Canadian, March 31) 283

Glund, W., and R. Kempf. An efficient strring apparatus. (July 15) 680

Grosvenor, W. M. A peculiar dust explosion. (New York, Jan. 31) 60

Haber, F. The fire-damp whistle. (Liverpool, Jan. 31) 54

Modern chemical industry (Hurter Memorial Lecture). (Liverpool, Jan. 31) 49

Hall, A. A. *See* Collins, S. H. 466

Harger, J. Coal and the chemistry of its carbonisation. (Liverpool, April 30) 389

Hargreaves, W. A. Blasting gelatine. Some notes and theories. (London, April 15) 337

Henderson, J. A. R. *See* Macleod, J. 299

Hendrick, J. The composition and agricultural value of carbonate of lime from causticising plant. (Scottish, Feb. 16) 122

Higgins, S. H. The waxes of textile fibres and their behaviour in the bleaching process. (Sept. 30) 902

Hoare, F. R. J. *See* Hodgkinson, W. R. 522

Hodgkinson, W. R. An application of calcium carbide in the formation of alloys. (London, May 15) 445

Reduction of chlorates to chlorides by hydrazine salts with the aid of a catalytic substance. (London, Aug. 31) 815

and F. R. J. Hoare. A reaction of tetranitromethane. (London, May 30) 522

Hough, A. T. Notes on the application of tungsten salts to the analysis of tanning materials. (London, Sept. 15) 847

Hübner, J. A contribution to the history of dyeing, with special reference to Scotland. (Manchester, May 15) 452

PAGE

Hyatt, J. W. Perkin Medal presentation. New York Section. (New York, March 16) 226
Innes, R. F. Some practical observations in the preparation of lime-arsenic paints. (Nottingham, June 15) 578
The relation between the "feel" of leather and its appearance under the microscope. (Nottingham, June 15) 579
Jackson, L. C., and others. The electrical conductivity of milk during its concentration, with suggestions for a practical method of determining the end point in the manufacture of sweetened condensed milk. (London, Jan. 31) 59
Jayne, D. W. The possibility of establishing a complete dyestuff industry in America. (New England, Dec. 31) 1178
Jennison, J. *See* Baker, A. 284
Johnstone, S. J. Monazites from some new localities. (London, Jan. 31) 55
Joseph, A. F., and W. N. Rae. Notes on alcoholometry. II. (Oct. 31) 991
Kempf, R. *See* Glund, W. 680
Knapp, A. W. Notes on gru-gru oil. (Birmingham, Jan. 15) 9
Knecht, E., and A. Lipschitz. The action of strong nitric acid on cotton cellulose. (Manchester, Feb. 16) 116
Kohlmann, E. The evolution of the refuse destructor. (Canadian, April 30) 383
Levinstein, H. A new process for producing fast prints on textile fibres. (Manchester, June 15) 573
Some new derivatives of indigo. (Manchester, June 15) 574
Lewis, E. A. A cheap form of rotating cathode and anode for rapid electrolytic analysis. (Birmingham, May 15) 445
The estimation of moisture in zinc ashes. (Birmingham, Dec. 15) 1119
Lipschitz, A. *See* Knecht, E. 116
Lloyd, F. E. The rubber and resin content of the desert rubber plant, "Guayule," in relation to rainfall. (Canadian, Feb. 16) 107
Lloyd, L. L. *See* Bland, N. 948
Lockett, W. T. *See* Ardern, E. 523, 1122
Macleod, J., and J. A. R. Henderson. Notes on naphthalene in coal gas. (Scottish, March 31) 299
McNab, L. *See* Jackson, L. C. 59
Martin, N. H. Germany and chemical industry. (Newcastle, Dec. 15) 1130
Melling, S. E. The purification of Salford sewage along the lines of the Manchester experiments. (Manchester, Dec. 15) 1124
Mersereau, G. Substitutes for automobile gasoline. (New York, June 30) 626
Miller, J. A field method for determining dissolved oxygen in water. (Yorkshire, Feb. 28) 185
Nagel, O. The application of jets for mixing purposes. (London, May 30) 522
O'Shaughnessy, F. R. Utilisation of the phenomena of putrefaction, with special reference to the treatment and disposal of sewage sludge. (Birmingham, Jan. 15) 3
Parsons, R. C. Apparatus for the automatic measuring and injection of chemicals. (London, May 30) 515
Pellew, C. E. Ferrosilicon and its dangers. (New York, Aug. 15) 774

PAGE

Perkin, F. M. By-products from peat. (London, April 30) 395
Philpot, J. T. *See* Smart, B. J. 900
Potts, H. E. Prediction and invention in chemistry. (Liverpool, April 30) 392
Powell, C. W. R. Determination of the viscosity of refined syrups and molasses. (Sydney, March 16) 238
A thermo-regulator for thermostats at temperatures very close to room temperature. (Sydney, Sept. 30) 899
See Fawsitt, C. E. 234
Radcliff, S. Extraction of radium from the Olary ores. (Sydney, March 16) 229
Rae, W. N. *See* Joseph, A. F. 991
Rakshit, J. N., and S. N. Sinha. Table of specific gravities of spirits. (London, March 31) .. 288
(Paper subsequently withdrawn and cancelled, see p. 619.)
Rideal, E. K. Studies on the reduction of uranium oxide. (London, July 15) 673
Rigg, G. Refractory materials. (New York, June 30) 619
Rittman, W. F. The theoretical problems involved in the cracking of oils. (New York, June 30) 626
Robertson, G. S. The solubility of mineral phosphates in citric acid. (Newcastle, Jan. 15) 9
Rose, T. K. Estimation of zinc in coinage bronze by volatilisation. (London, Feb. 28) 170
Rothera, A. C. H. *See* Jackson, L. C. 59
Schoeller, W. R. Oxygen and metallic antimony in crude antimony. (London, Feb. 28) .. 169
Schüpphaus, R. C. Who invented celluloid? (New York, July 15) 678
Shaw, T. W. A. The catalytic reduction of oleic acid and cottonseed oil by means of hydrogen in presence of finely divided nickel. (Liverpool, Aug. 15) 771
Singh, P. Nickel tannates. (London, Feb. 28) 172
Sinha, S. N. *See* Rakshit, J. N. 288
Smart, B. J., and J. T. Philpot. The volatilisation of arsenious acid from aqueous solutions containing hydrochloric acid. (Sydney, Sept. 30) 900
Snell, J. F. Commercial household ammonia in Canada. (Canadian, Dec. 31) 1177
Maple sap products and the Canadian standards. (Canadian, May 30) 507
Stead, J. E. Some of the ternary alloys of iron, carbon, and phosphorus. (Newcastle, Feb. 28) 173
Stevens, H. P. *See* Beadle, C. 727, 730
Strevens, J. L. The viscosity of oils. (London, Feb. 16) 109
Symons, C. T. *See* Browning, K. C. 819
Szász, E. Rapid and accurate method for the determination of carbon in iron and its alloys. (Oct. 31) 994
Toch, M. The chemistry of pine oil. (New York, June 15) .... 576; *errata*, 780
Weyman, G. The difference between the calculated and determined calorific values of coal gas. (Newcastle, Jan. 15) 11
White, J. The work of the Public Analyst in relation to manufactured products. (Abstract). (Nottingham, Dec. 31) 1180
Wollaston, T. R. Power and heat costs in chemical works. (Manchester, March 31) 293
Wright, L. T. The oxygen content of the gases from roasting pyrites. (London, Feb. 16) 111

Journal of the Society of Chemical Industry.

VOL. XXXIII.—1914.

NAME INDEX.

N.B.—In this Index (P) indicates that the matter referred to is an abstract of a patent.

Where the letter *r* follows the number of a page, it indicates, in the case of a patent, that a reference only to a previous patent appears on that page; in the case of articles other than patents, the title only of the article will be found on such pages.

The titles of new books are given within quotation marks.

A

PAGE

Aarts, J. G. Bituminous matters; Continuous fractional distillation of —— and apparatus therefor (P) 412, 474*r*
  Discharging carbonised products obtained in vertical retorts; Method and apparatus for —— (P) 542
  Gases from distillation of carbonaceous substances; Apparatus for recovering by-products from —— (P) 17
  Metal and carbon; Manufacture of agglomerates of reduced ——, called "ferro-carbonite" and "cupro-carbonite" (P) 697
Abady, J. *See* Simmance, J. F.......... 45
  See Taplay, J. G. 714
Abbott, B. N. Concrete; The painting of —— 964
Abbott, W. G., jun. Wool-scouring and like liquors; Recovery of ingredients from —— (P) 1006
Abderhalden, E., and E. Eichwald. Halogenhydrins; Synthesis of optically active —— 700
Abeles, V. Pitch; Determination of the softening temperature of —— 246
Abelin, I., and others. *p*-Aminophenyl ester of salicylic acid; Preparation of derivatives of —— (P) 220, 667
Aboulenc, J. *See* Senderens, J. B. 1114
Abraham, A. Soil or rocks; Process for making —— impervious (P) 933
Abram, H. H. *See* Ball, W. C. 75, 75
Abresch, E. *See* Brune, H. 781
Accumulatorenfabrik. *See under* Akkumulatorenfabrik.
Ach, L. *See* Boehringer, C. F., und Söhne 41
Achenbach, E. Electric battery (P) 756*r*
  Thermo-element (P) 1118
  See Porscke, H. P. R. L. 651*r*
Acker, C. E., and Nitrogen Co. Alkali and alkaline-earth metals; Production of —— (P) 1214*r*
Acker, E. *See* Chem. Fabr. Griesheim-Elektron 747*r*
  See Kunert, F. 479
Ackermann, F. *See* Act.-Ges. f. Anilinfabr. 247*r*
  See Mersey Chemical Works, Ltd. 19
Acland, L. H. D. Oils; Drying —— (P) 324
Acme Steel Goods Co. *See* Nelson, A. A. 1095
Acme White Lead and Color Works. *See* Holley, C. D... 149
Act.-Ges. f. Anilinfabrikation. Acetic anhydride; Preparation of —— (P) 667
  Acetylcellulose; Spreading coatings of —— on fabrics or other materials (P) 20, 350*r*
  Aminoanthraquinones or their derivatives; Manufacture of —— (P) 826
  Anthracene dyestuffs for wool; Manufacture of —— (P) 19, 348*r*
  Anthraquinone series; Manufacture of chloro derivatives of the —— (P) 18, 587*r*
  Anthraquinonecarboxylic acids and anthraquinonealdehyde-carboxylic acids; Manufacture of —— (P) 131*r*
  Azo dyestuffs; Manufacture of —— (P) 247*r*
  Azo dyestuffs for wool; Manufacture of mono —— (P) 71*r*
  Betaine or its salts; Manufacture of —— from molasses, exhausted molasses, and other residues of the beet sugar factory (P) 658, 935*r*
  Betaine salts; Manufacture of —— (P) 43*r*, 767
  Black colouring matter directly dyeing cotton; Manufacture of a ——. Action for infringement of patent 915
  Cellulose esters of organic acids; Manufacture of —— (P) 688

PAGE

Act.-Ges. f. Anilinfabrikation—*cont.*
  Cellulose nitrates; Manufacture of non-inflammable solutions of —— suitable for use as lacquers (P) 93, 838*r*
  Clothing, furs, skins, etc.; Protection of —— against moths, beetles, or insects, and killing domestic and agricultural pests (P) 939, 939*r*
  Drying pans, etc.; Apparatus for pouring wet, adhesive masses into —— (P) 583
  Dyeing hair and fur; Process for —— (P) 73, 309, 856*r*, 860*r*, 860*r*
  Dyeing pelts, hairs, feathers, etc.; Process for —— (P) 198*r* 252, 348*r*
  Frescoes, aquarelles, stereochromes, pictures painted with casein colours or *in tempera*, photographs, etc.; Process for cleaning and restoring —— (P)...... 325*r*
  Furs, skins, etc.; Protection of —— against attacks of moths or other insects (P) 308*r*
  Hydroxy derivatives; Manufacture of aromatic —— (P) 955
  Insects in furs, skins, etc.; Process for destroying —— (P) 640*r*
  2-Methylanthraquinone; Preparation of chloro-derivatives of —— (P) 18
  Photographic developers (P) 440
  Photographic silver prints; Conversion of —— into coloured prints (P) 569*r*
  Rubber: Imitation —— with a basis of acetylcellulose, and fabrics made therefrom (P) 431
  Safranine dyestuffs; Manufacture of derivatives of —— (P) 415
  Sulphide dyestuffs; Manufacture of —— (P) 131*r*, 348*r*, 639*r*, 743*r*, 743*r*, 784*r*, 856*r*
  See Witt, O. N. 545*r*
Akt.-Ges. Dynamit Nobel. Sodium bisulphate in a form in which it can be calcined directly; Manufacture of —— (P) 485*r*
A.-G. Peiner Walzwerk. *See* Küppers, H. 704 841*r*
Act.-Ges. f. Stickstoffdünger. *See* Krauss, C. 549
Act.-Ges. f. Vakuumverdampfanlagen. Evaporators; Process for supplying liquid to —— in which the liquid is circulated (P) 736
Acton, A. J. *See* Cohoe, W. P. 947
Adam, A. T. Steel castings; The annealing of —— 1156
Adam, M. A. Hydrogenation; Catalytic —— (P) 1226
  See Richards, F. R. G. 1160
Adams, M., and C. Hilton. Wood distillation under diminished pressure; Turpentine yield in —— 586
Adams, M. H. Filtered water from rivers; Apparatus for obtaining —— (P) 1169
Adams, W. Heating and cooling fluids; Apparatus for —— (P) 1080
Addicks, L. Copper: Commercial classification of refined —— 1054
  Copper; Impurities in cathode —— 1158
  and C. L. Brower. Metallurgical furnace (P) 144, 836
Adler, L. Barley, malt, and beer; Determination of the amino-acid- and polypeptide-nitrogen in —— .. 367
Adler, R. *See* Naamlooze Vennootschap Algem. Uitvinding Exploitatie Maatsch. 763*r*
Adolph, G. *See* Pietzsch, A. 146*r*, 200, 646*r*
Aglioubz, A. C., and G. A. Howkins. Iron; Composition for use in preserving —— (P) 652
"Ago" Lederkitt Industrie G. m. b. H. Adhesives or cements for leather (P) 153*r*
Agostinelli, C. Thujone and carvone; Action of ammonium hydrosulphide on —— 983

PAGE

Agulhon, H. Fatty acids; Solubility of certain metallic salts of volatile ——. Application to the detection of these acids 437
  See Bertrand, G. 105, 273
Ahlmann, N. Rotary furnaces and the like; Removing sediments or crusts from —— (P) 906
Ahnert, C. *See* Riboud, E. 327
Ahrens, F. Rubber; Vulcanisation of —— 93
Ainley, J. S. Textile piece goods, warp yarns, etc.; Machines for treating —— with liquids (P) 251, 1085
L'Air Liquide Soc. Anon. Compressed gases; Preventing the freezing of vapour during the discharge of —— from storage vessels (P) 633
  Desiccation of air or gases (P) 907, 908r
  Explosive cartridges containing liquid oxygen (P) 376
  Explosives with liquid air or liquid oxygen and protective sheaths or envelopes therefor (P) 1036r
  Gaseous mixtures; Separation of the constituents of —— (P) 1149
  Packing for machinery prepared from leather (P) 241
  See Claude, G. 137r
Aitken, J. E. *See* Menzies, R. C. 308r
Akerlund, G., and Standard Gas Power Co. Gas generator (P) 1148
Akers, H. G. Barium and strontium oxides; Production of —— (P) 1151
Akkumulatorenfabrik A.-G. Combustible or explosive gases, especially fire-damp: Device for detecting —— (P) 846
  Methane or other inflammable gases in air: Apparatus for measuring the content of —— (P) 190, 244, 505r
  Methane or other inflammable gases in air: Process and apparatus for detecting —— (P) 190
Aktiebolaget Kolm. Absorbent or decolorising substance; Manufacture of an —— (P) 1083
Aktiebolaget Separator. Milk; Process and apparatus for clarifying —— (P) 882
Aktschourin, J. Resin-soap and resin; Manufacture of —— (P) 150r, 838r
Albers, F. Betaine: Decomposition of —— by caustic potash. Preparation of hydrocyanic acid by destructive distillation of beet molasses 36
Albert, A. Cyanhydrins of aldehydes and ketones; Preparation of derivatives of —— (P) 667, 890, 985
Albert, K. Open-hearth furnace (P) 836r
  and others. Metals; Removal of the coating from plated —— by means of mercury (P) 835
Albert, Dr. K., Chem. Fabrik. *See* Berend, L. 930r
Albrecht. Beet slice dryers; Explosions in —— 433
Albright, A. R. Essential oils and their products; Hydrogen number of ——. Oils of sassafras, anise, fennel, clove, and pimenta 1113
Alco Deo Co. *See* Hoffman, A. 103
Alcock, F. H. Carbon bisulphide in official pharmacy, and suggestions for its further use 843
  Moisture in zinc ashes; Estimation of ——. Discussion 1120
  Naphthalene in spent oxide; Estimation of ——. Discussion 1122
Alder, A., and M. F. Coolbaugh. Lead in ores; Volumetric determination of —— 595
Alexander, J. Briquettes from coke dust, with or without wood waste; Manufacture of —— (P) .. 67, 636r, 1197r
Alexejew, A. *See* Von Weimarn, P. 670
Alford, H. C. Iron ores; Process for reducing —— (P) .. 698
Alinder, H., and Allis-Chalmers Manufacturing Co. Filter for slimes (P) 187
Allan, C. D. Kiln and heater; Combination —— (P) 780
Allbaugh, E. *See* Coup, J. 490r, 836r
Alleman, G. Creosote in well preserved timbers; Quantity and character of —— 832
Allen, E., and Co., Ltd., and others. Mills for crushing, grinding, pulverising, separating, or mixing (P) .. 126
Allen, E. A. Electrolysing saline solutions; Method and means for —— (P) 1008
Allen, F. B. Pottery plaster; The transverse test applied to —— 1049
Allen, G. S., and H. Deane. Belladonna leaves; Adulteration of —— 843
Allen, I. C., and others. Petroleums of California; Physical and chemical properties of —— 851
Allen, J. J. Coke ovens, etc.; Apparatus for charging —— (P) 823
Allen, J. L. Leather; Production of a non-slip, waterproof, chrome —— (P) 1064
Allen, K. Sewage; Clarification of —— by fine screens .. 980
Allen, T. B., and Carborundum Co. Abrasive compounds; Production of —— (P) 354
  Alumina; Method of bonding fused crystalline —— (P) 963
  Nitrogenous compounds; Process for making —— (P) 593
  Refractory articles; Manufacture of —— (P) 963
  and others. Electrical conductors (P) 1096

SUBJECT INDEX.

N.B.—In this Index (P) indicates that the matter referred to is an abstract of a patent.

Where the letter *r* follows number of page, it indicates that a reference only to a previous patent appears on that page; or, in the case of matter other than patents, that the subject is only referred to by title.

Acetyl value of oils, fats, etc.; Determination of the ——. Holland 701
β-Acetylalkylene-tetra-alkyldiamines. (P) Bayer und Co. 889
Acetylation of halogen-hydrocarbons; Process for ——. (P) Masland, and du Pont de Nemours Powder Co. 844, 844
Acetylcellulose articles; Process for cleaning and renewing ——. (P) Püschel 20, 196*r*
  coatings on fabrics, etc.; Process for spreading ——. (P) Act.-Ges. f. Anilinfabr. 20
  and its commercial uses. Schwabe 131
  Imitation rubber with a basis of ——. (P) Act.-Ges. f. Anilinfabr. 431
  Manufacture of ——. (P) Knoll und Co. 308*r*
  Manufacture of —— insoluble in acetic acid and in chloroform. (P) Knoll und Co. 746
  solutions; Manufacture of ——. (P) Reid, and Eastman Kodak Co. 640
  solutions; Preparation of white or coloured opaque objects from primary ——. (P) Knoll und Co. 916
Acetylcholine, a new active principle of ergot. Ewins 664
Acetylene; Behaviour of —— in alkali fusions. Feuchter 414
  burner for use as a standard source of light. Jones 1197
  from calcium cyanamide; Explosion of —— in Trieste Harbour. Morpurgo 482
  Conversion of —— into acetaldehyde. (P) Consort. f. Elektrochem. Industrie 42, 440*r*
  Electrolytic production of acetic acid from ——. (P) Bayer und Co. 830
  Physiological characteristics of —— with respect to its use in mining. Smith 610
  Preparation of hydrohalogen addition products of ——. (P) Chem. Fabr. Griesheim-Elektron 277
  Production of acetic acid from ——. (P) Bayer und Co. 830
  Quantity of —— necessary to cause an explosion in a closed space. Bosnische Elektricitäts A.-G. 1141
  Storage of dissolved ——. (P) Wilkinson 953
  in welding and cutting; Precautions in using ——. 1159
Acetylene tetrachloride; Conversion of —— into trichloroethylene. (P) Chem. Fabr. Buckau 807
Acetylnitrocelluloses and their utilisation for celluloid. Nishida 476
Acetylsalicylic acid; Manufacture of —— 887
  Manufacture of the calcium salt of ——. (P) Soc. Chimique des Usines du Rhône 220
  Manufacture of salts of ——. (P) Gerngross and Kast 439, 613*r*, 807*r*
  Preparation of halogen-alkyl esters of ——. (P) Wolffenstein 1172
  Preparation of a salt of —— with urea. (P) Schütz und Co. 806
Acetylstrychninolone; Oxidation of ——. Leuchs and Schwaebel 663
Acid; Apparatus for testing the specific gravity of —— in cells with sealed covers. (P) D. P. Battery Co., Ltd., and Elliott 795
  catalysts. Mailhe 437
  gases; Process and apparatus for blowing ——. (P) Wolf, and Burgess Sulphite Fibre Co. 789

Acid—*cont.*
  liquids ; Process for the continuous distillation of ——. (P) Hof 121, 646r
  lyes ; Method and apparatus for neutralising ——. (P) Ekstrom 785
  -proof packing material. (P) Chappell 931
  -resisting pipes and vessels for use in concentrating sulphuric acid ; Manufacture of ——. (P) Strzoda 843
  sludge produced in washing mineral oils ; Process for working up the ——. (P) Rutgerswerke A.-G. 173r
  from stick lac ; A new ——. Gasard 875
  tanks ; Mastic lining for ——. 420
  tar formed in refining mineral or tar oils ; Separation of ——. (P) Burkhardt 305
  from tin plate works, etc. ; Treatment of the waste ——. (P) Anderson 312
  vapours ; Apparatus for condensing ——. (P) Leblanc 311

Acid-proof elastic material ; Manufacture of ——. (P) Magelssen 259
  fabrics ; Production of ——. (P) Western Precipitation Co. 308

Acidity of leather ; Determination of the ——. Nicolardot 606

Acids ; Absorption of —— by wool. Fort and Lloyd 133
  Autoxidation of organic —— by the action of light. Ciamician and Silber 334
  in beer ; Colorimetric determination of ——. Lüers 761
  derived from colophony ; Melting points of ——. Paul 557
  Displacement of —— from salts by hydrogen peroxide. Sperber 135
  in essential oils ; Determination of volatile ——. Umney 566
  Exportation of —— from Italy 1204
  fatty, containing arsenic ; High-molecular ——. (P) Bayer und Co. 161r
  fatty ; Bleaching of ——. (P) Reuter 603r
  fatty, containing arsenic and halogen ; Manufacture of salts of high molecular ——. (P) Fischer, and Synthetic Patents Co. 307r, 307r
  fatty, containing arsenic and phosphorus ; Manufacture of —— :
    (P) Bayer und Co. 614r
    (P) Heinemann 218, 438
  fatty, containing arsenic and phosphorus ; Preparation of iron salts of ——. (P) Heinemann 503, 767
  fatty ; Catalytic reduction of unsaturated —— by means of nickel and nickel oxide. Meigen and Bartels 323
  fatty ; Conversion of unsaturated —— into saturated compounds :
    (P) Bedford and Williams 324
    (P) Bedford and others 429r
    (P) Nordiske Fabriker De-No-Fa Aktieselskap 324
  fatty ; Decomposition of —— by mould fungi. Spieckermann 323
  fatty ; Detection and determination of solid hydrocarbons in admixture with ——. Verona-Rinati 1214
  fatty ; Electrical conductivity of potassium salts of the ——. Bunbury and Martin 323
  fatty ; Electrolysis of molten salts of the ——. Petersen 666
  fatty ; The Fachini-Dorta method of separating liquid from solid ——. De Waele 972
  fatty ; Hydrogenation of ——. (P) Humphreys 797
  fatty, of Japanese sardine oil ; Highly unsaturated ——. Majima and Okada 362
  fatty ; Manufacture of —— and glycerin. (P) Twitchell 148r
  fatty ; Melting and solidifying points of mixtures of ——, and use of these points to determine the composition of such mixtures. Twitchell 797
  fatty, from oils and fats ; Manufacture of ——. (P) Twitchell 652r
  fatty ; Preparation of a mixture of salts of lower ——. (P) Ederer 568, 667
  fatty ; Process for decolorising ——. (P) Petroff and von Tischenko 875
  fatty ; Process for hydrogenating unsaturated —— or their esters. (P) Maryott 702
  fatty ; Reduction or hydrogenation of ——. (P) Wimmer and Higgins 32r
  fatty ; Reduction of unsaturated ——. (P) Fuchs 652r
  fatty, in soap ; Determination of the ——. Besson 702
  fatty ; Solubility of certain metallic salts of volatile —— in organic solvents. Application to the detection of these acids. Agulhon 437
  fatty ; Synthetic —— from petroleum. Colletas 972
  fatty, from train oil or fish oil ; Process for deodorising ——. (P) Hofmann 324, 492r
  from hydrolysed lignocelluloses ; Separation of volatile ——. (P) Lederer and Lederer 478
  Iodometric determination of —— by aid of picric acid. Sander 441
  Method and means for distilling ——. (P) Hof 421, 646r, 790r
  from nitrocellulose manufacture ; Source of error in the analysis of waste ——. Chandelon 334
  Use of manganous oxide for the catalysis of ——. Sabatier and Mailhe 437, 501
  in wort ; Colorimetric determination of ——. Lüers 761

Acidylcellulose ; Manufacture of threads, etc., from ——. (P) Knoll und Co. 746

Acidyl-o-hydroxyphenylcarboxylic acids ; Manufacture of alkali salts of ——. (P) Wülfing 613

Acidylsalicylic acids ; Preparation of halogen-alkyl esters of ——. (P) Wolffenstein 1172, 1172

Acridine derivatives from aminonaphtholsulphonic acids ; Preparation of ——. (P) Meister, Lucius, und Bruning 637

Acridones of the benzanthrone series ; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 115

Acrocomania sclerocarpa ; Oil of —— (Gru-gru oil). Knapp 9

Acrolein ; Preparation of ——. Witzemann 941

Actienges. f. Anilinfabrikation ; Explosion at the works of the —— at Rummelsberg 376, 712

Acyl-p-diaminoanthraquinones ; Manufacture of 3-nitro compounds of ——. (P) Bayer und Co. 70

Acyl-o-hydroxycarboxylic acids ; Magnesium salts of ——. (P) Berendes and others 1226

Acylsulphuric acids and their alkali and alkaline-earth salts ; Manufacture of ——. (P) Naamlooze Vennootschap Fabriek van Chemische Produkten 219, 569r

Adhesive substance from seaweed ; Preparation of a light-coloured ——. (P) Krefting, and Norsk Tang-syndikat 540, 579r
  substance from starch for use as size ; Production of an ——. (P) Casein Co. of America 97r

Adhesives ; Analysis of soluble ——. Armani and Barboni 433
  giving with cold water strong cementing masses ; Manufacture of ——. (P) Kantorowicz 879r
  for leather. (P) " Ago " Lederkitt Industrie 153r

Admixture of two or more liquids ; Method and apparatus for automatically controlling the proportionate ——. (P) Bramwell 999

Adonis vernalis ; Constituents of ——. Mercier 664

Adsorption. Schmidt-Walter 1174
  in dyeing. Blucher and Farnau 1085
  Negative ——. Williams 505
  in solutions. Von Georgievics 251
  by zirconium hydroxide. Wedekind and Rheinboldt 787

Adsorptions ; Production of metal ——. (P) Schwerin, and Ges. f. Elektro-Osmose 750r

Aerating liquids ; Apparatus for ——. (P) Irwin 274, 274, 823r
  liquids or pulps ; Apparatus for ——. (P) Howard, and Minerals Separation, Ltd. 127r
  solutions ; Method of ——. (P) Darrow 87

Africa ; Natural soda deposits of ——, with notes on the alkali trade. Watson 74

Agar-agar preparation giving clear solutions ; Production of an ——. (P) Merck 568
  Purification of ——. (P) Steinitzer 274

Agglomerates for constructional purposes. (P) Langlois and Langlois 423r

Agglomerating coal and other powdered materials ; Process for ——. (P) Steven 635
  fine ores and metalliferous products ; Process for ——. (P) Pretceille and others 650r
  finely-divided granular or friable materials ; Process for ——. (P) Kroll 302r
  finely-divided material for fuel ; Process for ——. (P) Soc. Houillère du Nord d'Alais 243
  ores and like material. (P) Weeks, and Dwight and Lloyd Sintering Co. 755r
  powdered carbon, metals, etc., to produce articles for electrical and other purposes. (P) Comp. Franç. de Charbons pour l'Electricité 850
  See also Briquetting.

Agitating apparatus :
    (P) Goldman, and Galvanische Metall-Papier Fabrik A.-G. 469
    (P) Williams 306
  apparatus for liquid slimes. (P) Symmes 30
  apparatus for treating ores. (P) Fields 1015
  liquids by means of compressed air, etc. (P) Dampfkessel- u. Gasometerfabr., and Deutsche Teerproduktenvereinigung Ges. 14
  liquids or pulps ; Apparatus for ——. (P) Howard, and Minerals Separation, Ltd. 127r
  pulp ; Process and apparatus for thickening and ——. (P) Dorr 950
  solid bodies in a liquid ; Apparatus for ——. (P) Robinson and Robinson 1153

Agitation of slimes for cyanidation. Megraw 83

Agricultural Experiment Station, Stockholm ; Report of the ——. Söderbaum 34
  experiments ; Distribution of the overhead electrical discharge used in recent ——. Jorgensen and Priestley 1066

Agriculture ; Application of electricity and radioactivity to ——. Baker 35
  Manufacture of fat lime for use in ——. (P) Filleux 655

Air ; Apparatus for ascertaining the purity of ——. (P) Leon 770r
  Apparatus for drying purified ——. (P) Fleming 780
  Apparatus for separating water from compressed ——. (P) Woollard, and Brotherhood, Ltd. 583

Allene; Polymerisation of ——. Lebedeff 1224
  series; Velocity of polymerisation of hydrocarbons of the ——. Lebedeff 1224
Allenic group, C:C:C; Polymerisation as a means of detecting the ——. Lebedeff 1225
Allotropy; Influence of —— on the metastability of metals, and its bearing on chemistry, physics, and technology. Cohen 1159
Alloy:
    (P) Gleason, and Neu-Metals and Process Co. 554
    (P) Graf and Welsh 794
    (P) Monkhouse and Denton 87, 836r
    (P) Parsons and Silberrad 927
    (P) Parr 1161
    (P) Smith 1161
    (P) Van Gundy 794
    (P) Wein and Strauss 869
    (P) Westley 488
  Non-oxidisable ——. (P) Coup and Allbaugh 490r, 836r
  Pyrophoric ——. (P) Faehr, and Elektrochemische Werke 836r
  for white metal goods. (P) Wilkins 425
Alloying of electrolytically deposited metals. Schlötter 318
Alloys; Antifriction ——. (P) Billington 698
  Application of calcium carbide in the formation of ——. Hodgkinson 445
  Capacity for heat of —— between 18° and 600° C. Schübel 649
  containing cobalt. (P) Haynes 264r
  Determination of the density and viscosity of some molten ——. Arpi 142
  Electrical separation of —— and their examination. Kremann and others 28, 553, 752, 791, 792
  Formation and application of ——. (P) Morcom 1013
  Fractionation of —— in the electric micro-furnace. Fletcher 104
  of high-fusing metals; Manufacture of ductile bodies from ——. (P) Liebmann and Hofheimer 1058
  of high melting point; Manufacture of ——. (P) Wolfram Lampen A.-G. 835
  Influence of coalescence on the mechanical properties of ——. Portevin and Bernard 1011
  Lining for electric furnaces for producing ——. (P) Ges. f. Elektrostahlanlagen, and Rodenhauser 319
  Manufacture of ——:
    (P) Goldmerstein 793, 795r
    (P) Kraus, and General Electric Co. 425
    (P) Ormiston 756r
  Manufacture of articles of refractory ——. Opposition to grant of patent to Schwarzkopf and others 1015

PAGE

Alloys—*cont.*
  Manufacture of bodies of refractory ——. (P) Schwarzkopf and others 650r
  Manufacture of ——. Especially from metals of widely different melting points. (P) Mauser 755
  Method of measuring the colour of ——. Thompson and Sinkinson 597
  Nomenclature of ——. First Report of the Institute of Metals Committee 318
  Preparation of ——. (P) Strohmenger 144r
  Process for casting ingots of —— and apparatus therefor. (P) Durville 699
  Process for casting from volatile ——. (P) Hall 795
  Process for improving ——. (P) Wilm 144r
  Process for protecting —— against corrosion. (P) Kaiser 600
  Production of ——. (P) Goldmerstein 793, 795r
  Pumping apparatus for making long pipes, etc., from molten ——. (P) Debauge 320, 425, 598
  resistant to the action of concentrated acids; Production of ——. (P) Borchers and Borchers .. 206r, 836r
  Salicylate electrolytes for use in electrodeposition of ——. (P) Marino 86, 600r
  Separation, detection, and estimation of elements in ——. (P) Fletcher 105
  Specific heat of metallic ——. Saposhnikow 1094
  Treatment of —— to render them ductile and malleable. (P) Westinghouse Metallfaden Glühlampenfabrik .. 554r
  of tungsten or other highly refractory metals; Manufacture of ——. (P) Kreusler, and General Electric Co. 1015r
  usually thought unsuitable for the manufacture of plated ware; Production of adherent deposits of precious metals on ——. (P) Murat 970
  The Widmanstätten structure in various ——. Belaiew 925
Allyl halides; Preparation of ——. (P) Chem. Fabr. vorm. Schering 220
C-Allyl-*o*-hydroxybenzoic acids; Preparation of derivatives of ——:
    (P) Bayer und Co. 806
    (P) Taub and others 1115r
C-Allylphenols and their analogues; Process for producing ——. (P) Claisen 220, 221r
C-Allylsalicylic acid. (P) Claisen, and Synthetic Patents Co. 567
Almond oil; Acidity of ——. Umney 556
Alum in foods; Use of ——. Report of the Remsen Board .. 563
Alumina; Manufacture of ——. (P) Kalmus and Savell .. 421
  Manufacture of sintered ——. (P) Dantsizen, and General Electric Co. 648r
  Method of bonding fused crystalline ——. (P) Allen, and Carborundum Co. 963
  Precipitation of —— in presence of fluorides. Cavaignac 481
  Purification of ——:
    (P) Chappell 23
    (P) Cohen and Chappell 23
Aluminate-silicates; Manufacture of granular or laminated —— allowing liquids to pass readily. (P) Permutit Akt.-Ges. 865
Aluminates; Preparation of base-exchanging ——. (P) Permutit Akt.-Ges. 549
  Synthesis of ——. Pukall 863
Aluminium alloy; Coating metals with —— to protect against high temperatures. Allison and Hawkins 1159
  alloy, duralmin; Use of the —— for making domestic and cooking utensils. Fendler and Stüber 331
  alloy; Hard ——. (P) De l'Or 144
  alloys:
    (P) Bayliss and Clark 264r, 1214r
    (P) McAdams 489, 650, 794, 869, 970, 1161
    (P) Naylor and Hutton 31r
    (P) Suchier 600
    (P) Van Gundy 794
  alloys; Flux and process for purifying ——. (P) Mellen, and United Aluminium Ingot Co. 554
  Analytical separation of zirconium from —— by aid of "cupferron." Thornton and Hayden 944
  alloys; Antifriction ——. (P) Esnault-Pelterie 88
  alloys; A hot-shortness testing machine for ——. Norton 1013
  and its alloys; Manufacture of a flux for ——. (P) Gelly 489, 600r
  alloys; Preparing the surface of —— to receive a metallic deposit. (P) L'Aluminium Français 599
  and aluminium wares. Board of Trade Bulletin 1013r
  Analysis of commercial —— and of its light alloys. Belasio 424
  apparatus; Destruction of —— by the galvano-catalytic action of copper. Pikos 340
  -bronze; Attempts to produce —— electrolytically. Kremann and others 752
  cathode; Disintegration of the ——. Campbell 970
  -copper alloys; Influence of nickel on some ——. Read and Greaves 316
  copper, and nickel; Alloys of ——. Guillet 358
  Deposition of nickel or other metals on ——. (P) L'Aluminium Français 599
  Detection of traces of ——. Petit 162
  die-castings. Norton 1013
  Direct nickeling of ——. (P) Canac 88
  Electroplating —— with nickel. Canac and Tassilly .. 142

Aluminium—*cont.*
  in gold; Dilute solutions of ——. Heycock and Neville 867
  Improving the properties of —— by alloying with cobalt. Neuberger 203
  Influence of impurities in the electrolyte or the electrolytic valve action of ——. Schulze 601
  and iron; Analytical separation of ——. Borck 104
  -magnesium alloys; Supplement to the phase diagram of ——. Schirmeister 1159
  in iron and manganese ores; Determination of ——. U.S. Bureau of Standards 139
  Method of increasing the resistance of —— to corrosion. (P) Vogelsanger 554
  in mineral waters; Determination of ——. Dede 156
  Nickel-plated ——. Tassilly 697
  Process for obtaining ——. (P) McIlhiney 144
  Process for protecting and decorating ——. (P) Tronel 700, 795r
  Production of a coating on —— resistant to sea-water and concentrated acids and alkalis. (P) D'Amico 700, 927r
  Production of colorations and black shades on ——. (P) L'Aluminium Français 489
  production in the United States in 1913. Phalen 961
  Purification of —— and flux therefor. (P) Mellen, and United Aluminium Ingot Co. 554
  Separation of zirconium from ——. Ferrari 1228
  -silicon alloys. Roberts 648
  -silver alloys; Hardness of ——. Pétrenko 1211
  Silvering —— electrolytically, without preliminary coppering. (P) Bévenot 599
  solders:
    (P) Bailey, and Navaltum, Ltd. 30
    (P) Koenig 599
  surfaces; Preparation of —— to receive a metallic deposit. (P) L'Aluminium Français 599
  Treatment of materials containing ——. (P) Bassett .. 23
  wire; Method of insulating ——. (P) Presser 1214r
  World's production of —— 833
Aluminium acetate compounds soluble in water; Preparation of ——. (P) Kalle und Co. 568, 750r
  chloride; Manufacture of —— from residues from the treatment of petroleum oils. (P) McAfee 783
  compounds with organic substances; Action of magnesium salts on complex ——. Quartaroli 591
  compounds; Solutions of ——. (P) Spence, Craig, and Spence and Sons, Ltd. 1153
  compounds; Treatment of materials containing ——. (P) Bassett 644
  fluoride; Manufacture of ——. (P) Doremus 1009
  halogen compounds from natural double silicates; Manufacture of ——. (P) Van der Leeden 865, 865r
  hydroxide; Acidic and colloidal properties of ——. Slade and Polack 481
  hydroxide; Manufacture of ——. (P) Bassett 23
  hydroxide; Method of precipitating ——. (P) Fickes .. 137r
  hydroxide; Some reversible hydrosols derived from ——. Rose 829
  nitride with alkali or alkaline earth nitride; Manufacture of double compounds of ——. (P) Peniakoff 644
  nitride; Conversion of —— into alumina and ammonia. (P) Milde, and Aluminium Industrie A.-G. 1207
  nitride; Manufacture of ——:
    (P) Serpek 421, 550r
    (P) Soc. Générale des Nitrures 313r, 550r, 643
  nitride; Manufacture of —— in electric arc furnaces. (P) Aluminium-Industrie A.-G. 643
  nitride; Manufacture of —— and electric furnace therefor. (P) Coutagne 312
  nitride; Method of heating electric furnaces for making ——. (P) Soc. Générale des Nitrures 427, 555r
  nitride; Preparation of —— from its elements. Wolf 642
  nitride; Process for decomposing ——. (P) Coutagne .. 865
  nitride; Synthesis of ammonia by means of ——. Matignon 829
  oxide and carbide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  perchlorate. Weinland and Ensgraber 74
  salts; Influence of —— on the growth of plants. Pfeiffer and Blanck 1101
  -sodium fluoride and colloidal silicic acid; Simultaneous production of ——. (P) Humann and Teisler 750r
  -sodium fluoride; Manufacture of an ——. (P) Humann und Teisler 200
  sulphate and ferric sulphate; Mutual solubility of ——. Wirth and Bakke 591
  sulphate in mechanical water purification; Relation between colour and ——. Hale 834
  sulphite; Oxidation of —— to the sulphate by means of air. (P) Beringer 312
Aluminosilicate compounds for the purification of water; Manufacture of ——. (P) De Brünn 372
Aluminosilicates; Manufacture of hydrated ——. (P) Gans and Riedel 353r, 353r
Alundum; Measurement of the high-temperature electrical resistivity of ——. Northrup 264
  Method and apparatus for calcining and treating ——. (P) Chappell 484
Amalgamator. (P) Dennison 1058
Amalgams of alkali and alkaline-earth metals; Process for decomposing ——. (P) Helbig 830

- Manufacture of lakes from ——. (P) Bayer und Co. 492, 876
- Manufacture of vat —— :
  - (P) Badische Anilin und Soda Fabrik 71, 416*r*, 416*r*, 638, 828*r*, 828*r*, 828*r*
  - (P) Bayer und Co. 195, 415, 415, 1151*r*
  - (P) Cassella und Co. 195, 827*r*
  - (P) Chem. Fabr. Griesheim-Elektron 19*r*
  - (P) Kardos 827
  - (P) Meister, Lucius, und Brüning 195, 195
  - (P) Schaarschmidt 416
  - (P) Soc. of Chem. Industry in Basle 639*r*
  - (P) Wedekind und Co. 247, 348*r*, 415
- Mono- and dihydroxyanthraquinones ; Dyeing properties of ——. Hüttig 589
- Naphthazarin derivatives ; Dyeing or printing with ——. (P) Soc. of Chem. Industry in Basle 197
- 2-Nitroquinizarin ; Manufacture of ——. (P) Bayer und Co. 19, 306*r*
- Preparation of vat ——. Schaarschmidt 587
- Purpurincarboxylic acid ; Preparation of ——. (P) Bayer und Co. 545, 784*r*, 828*r*
- Quinizarin ; Manufacture of ——. (P) Bayer und Co. 347*r*
- Quinizarin-β-carboxylic acids ; Preparation of ——. (P) Bayer und Co. 784
- 1.2.3.4-Tetrachloroquinizarin. Hövermann 544
- for wool ; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 19, 348*r*

Anthracenecarboxylic acids ; Sensitiveness of —— to light. Weigert and Kummerer 913

Anthracite ; Preservation of —— under water. D'Estape 1193

Anthraquinone ; Benzyl derivatives of ——. Tschilikin .. 956
- derivatives ; Manufacture of —— :
  - (P) Badische Anilin und Soda Fabrik 131*r*, 194, 348*r*, 348*r*, 544
  - (P) Bayer und Co. 347*r*, 413
  - (P) Brass 247
  - (P) Scholl 783, 783
- derivatives containing sulphur ; Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron 545, 915*r*
- Effect of magnesium chloride on the oxidising action of chlorates and nitrates in the preparation of ——. Hofmann and others 742
- Manufacture of —— :
  - (P) Chem. Fabr. Griesheim-Elektron 826
  - (P) Meister, Lucius, und Brüning 638
- The present condition of the chemistry of ——. Schmidt 1039
- series ; Carbazole derivatives of the ——. Ullmann and Illgen 246

PAGE
Anthraquinone—*cont.*
  series; Manufacture of nitrogenous condensation products of the ——. (P) Meister, Lucius, und Brüning 193, 413, 474, 475, 637, 638
  Anthraquinone-aldehyde. Eckert 955
Anthraquinone-aldehydecarboxylic acids; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 131*r*
Anthraquinonecarboxylic acids; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 131*r*
Anthraquinone-α-nitriles; Preparation of ——. (P) Meister, Lucius, und Brüning 637
Anthraquinone-N-1.1′-oxazine; Preparation of ——. (P) Meister, Lucius, und Brüning 638
Anthraquinone-thiazoles; Production of ——. (P) Badische Anilin und Soda Fabrik 588*r*
Antifouling varnishes and paints. (P) Collardon 324
Antifriction alloy of aluminium. (P) Esnault-Pelterie 88
  metals. (P) Billington 698
  metals; Determination of antimony and arsenic in ——. Bertiaux 262
Antimony-bronze; Attempts to produce —— electrolytically. Kremann and others 752
  in copper; Determination of ——. Brownson 141
  Detection of —— in qualitative inorganic analysis. Petersen 891
  Determination of —— in lead-antimony alloys and antifriction metals. Bertiaux 262
  Extraction of ——. (P) Szilard 321
  Extraction of —— from ores. (P) Price and Lewis 927
  ores; Process for treating ——. (P) Trifonoff and Gardner 755*r*
  Oxygen and metallic antimony in crude ——. Schoeller 169
Antimony-arsenic compounds; Manufacture of organic ——. (P) Meister, Lucius, und Brüning 102, 375, 438, 985*r*, 1075
  compounds; Preparation of amino derivatives of primary aromatic ——. (P) Chem. Fabr. von Heyden 438
  oxide; Manufacture of ——. (P) Stark, and Enamel Co. of America 644
  trichloride; Electrolysis of —— in presence of colloids. Mazzucchelli 1213
Antipyrine; Determination of ——. Emery and Palkin .. 983
  Manufacture of —— 887
Antipyrylquinoline-4-carboxylic acid; Preparation of 2- or 3- ——. (P) Meister, Lucius, und Brüning 439
Antiseptic product derived from salicylic acid. (P) Weitz .. 843*r*
  properties of organic compounds; Relation between the —— and their structure and composition. Charitschkow 763
  substances; Preparation of ——. (P) Riedel A.-G. .. 984
Apocynaceæ; Substance isolated from ——. (P) Bayer und Co. 1115*r*
Aporeine and its salts. Pavesi 611
Apples; Copper in ——. Government Laboratory Report 892
Apricot kernel oil; Acidity of ——. Umney 556
Aqua regia; Chlorination by means of ——. Datta and Fernandes 1198
  Simultaneous chlorination and oxidation by means of ——. Datta 1198
Aquarelles; Process for restoring and cleaning ——. (P) Act.-Ges. f. Anilinfabr. 325*r*
Arabinose; Cupric reducing power of ——. Daish 1067
Arachis oil; Residues from the refining of ——. Bouchard 428
Arcs *and* Arc lamps. *See under* Electric.
Ardeer; Circumstances of an explosion in an incorporating house at ——. Cooper-Key 668
Argemone Mexicana; Oil of ——. Bhaduri 266
Argentina; Sugar production of —— in 1913 933
Argentum colloidale and *Argentum proteinicum*; Titration of silver in ——. Korndörfer 1225
  colloidale; Simple method of valuing ——. Lehmann 1074
Argillaceous sediments; Chemistry of the ——. Linck 1164
Argon; Method of obtaining ——. (P) Bucher, and Nitrogen Products Co. 962
Aristoquinine. Biginelli 710
Armour plate; Process for treating ——. (P) Wales, and Carnegie Steel Co. 698
  plates:
    (P) Soc. Anon. des Aciéries et Forges de Firminy 204, 204
    (P) Wales, and Carnegie Steel Co. 1057
  plates; Manufacture of ——. (P) Soc. Anon. Italiana Gio. Ansaldo, Armstrong & Co. 321*r*
  plates; Production of —— without case-hardening. (P) Lucertini 1015*r*
  plates; Treatment of ——. (P) Mitchell and others .. 792
Army cloths; The dyeing of —— 1005
Arsacetin. Boon 1188
Arsenic in copper; Determination of ——. Brownson 141
  Determination of —— in lead-antimony alloys and antifriction metals. Bertiaux 262
  Determination of traces of —— of the order of 0·001 mgrm. Moreau and Vinet 442
  Extraction of ——. (P) Szilard 321

PAGE
Arsenic—*cont.*
  Extraction of —— from ores. (P) Price and Lewis 927
  in hydrochloric acid; Determination of ——:
    Koelsch 74
    Tarbell 590
  Iodometric determination of ——. Lander and Geake 376
  in iron and iron ores; Iodometric determination of ——. Brandt 28
  -lead alloys; Solidification diagram of ——, and the melting point of arsenic. Heike 553
  -lime paints; Practical observations in the preparation of ——. Innes 578
  Melting-point of ——:
    Goubau 135
    Heike 697
  in official substances and preparations; Limits of ——. British Pharmacopœia 982
  ores; Treatment of ——. (P) Trifonoff and Gardner .. 755*r*
  Quantitative separation of —— from metals by means of hypophosphorous acid. Brandt 504
  in sulphuric acid; Determination of ——. Nisjenson .. 1086
  in sulphuric acid; Determination of ——:
    Koelsch 74
    Tarbell 590
Arsenic acid; Reduction of —— to arsenious acid by thiosulphuric acid. Chapin 481
Arsenic-antimony compounds; Manufacture of organic ——. (P) Meister, Lucius, und Brüning .. 102, 375, 985*r*, 1075
  with antimony, phosphorus, selenium, and tellurium; Preparation of organic compounds of ——. (P) Meister, Lucius, und Brüning 375, 438
  -bismuth compounds; Preparation of organic ——. (P) Meister, Lucius, und Brüning 375
  compounds; A new class of aliphatic ——. Fischer .. 334
  compounds; Organic ——. Boon 1187
  compounds; Preparation of easily soluble organic ——. (P) Bart 568
  compounds; Preparation of organic ——:
    (P) Bart 41, 218
    (P) Meister, Lucius, und Brüning 375
  Explosive substance containing ——. Müller 748
  and gold; Alloys of ——. Streicher 357
  trioxide in plate glass manufacture; Behaviour of ——. Gelstharp 77
Arsenical compounds combined with silver and antimony salts for the treatment of trypanosomatic diseases. Danysz 942
Arsenious acid; Volatilisation of —— from aqueous solutions containing hydrochloric acid. Smart and Philpot 900
Arsenite solutions; Determination of the titration value of ——. Deiss 442
Arseno-compounds; Preparation of reduction products of organic ——. (P) Bart 438
  Preparation of unsymmetrical ——. (P) Meister, Lucius, und Brüning 438
Arseno-metal compounds; Preparation of ——. (P) Meister, Lucius, und Brüning 438, 502
Arsenomethylphenylglycine; Preparation of ——. (P) Poulenc frères, and Oechslin 276
Arseno-precious metal compounds; Preparation of organic ——. (P) Meister, Lucius, und Brüning 218
Artemesia arborescens, L.; Oil of ——. Jona 1072
Aryl-alcohols; Direct catalytic hydrogenation of ——. Sabatier and Murat 347
Arylaminomethylalkyl ethers; Preparation of ——. (P) Merck 668
Arylcarbamic acid esters; Preparation of ——. (P) Meister, Lucius, und Brüning 667
Arylides of 2.3-hydroxynaphthoic acid and formaldehyde; Manufacture of condensation products from the ——. (P) Chem. Fabr. Griesheim-Elektron 742
  of 2.3-hydroxynaphthoic acid; Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron .. 70, 475*r*, 742*r*
  of 2.3-hydroxynaphthoic acid; Manufacture of azo dyestuffs from the ——. (P) Chem. Fabr. Griesheim-Elektron 915
α-Arylides of β-naphthisatin: Production of ——. (P) Bayer und Co. 246, 587*r*
2-Arylquinolinecarboxylic esters or their derivatives; Preparation of ——. (P) Chem. Fabr. vorm. Schering 943
2-Arylquinoline-4-carboxylic acids; Manufacture of ——. (P) Chem. Fabr. vorm. Schering 439, 889
  Manufacture of sulpho compounds of ——. (P) Chem. Fabr. vorm. Schering 42, 503*r*
Asbestos: Purification of ——. (P) Whitney, and General Electric Co. 593*r*
Ash content of drugs; Proposed limitation of —— for the U.S. Pharmacopœia IX. Wilbert 1171
Aspen; Effect of varying certain cooking conditions in the production of soda pulp from ——. Surface 1151
Aspergillus glaucus; Fermentation of some sugars by means of ——. Tractta-Mosca 935
Aspergillus niger; Value of zinc for the growth of —— in deep media. Javillier 563

PAGE

- *Aspergillus oryzae*; Enzymes of ——, and application of its amyloclastic enzyme to the fermentation industry. Takamine 1068
- Asphalt for compressed asphalt pavements; Manufacture of ——. (P) Wallbaum 315
  - industry; Production of a tough viscous mass for the ——. (P) Goepper and Geiger 27*r*
  - -like masses and derivatives therefrom; Manufacture of ——. (P) Landsberg 543*r*
- Asphaltic material; Determination of —— in petroleum by the so-called excise method. Gurwitsch 1147
- Asphaltites; Distinguishing —— from friable petroleum residues. Marcusson 740
- Asphaltum; Chemistry and analysis of ——. Marcusson .. 739
  - in dark petroleums; Determination of ——. Holde and Meyerheim 303
  - Detection of petroleum pitch in ——. Halphen and Spiess 189
  - Determination of the melting point of ——:
    - Marcusson 740
    - Miller and Sharples 1196
    - Schanin 470
  - Differentiation of natural —— from oil-asphaltum. Pailler 470
  - Manufacture of —— from crude oil or residuum. (P) Forward 344
  - in mineral oil; Determination of ——. Kantorowicz .. 66
  - Navaho ——. Rosenthal 739
  - penetrometer; An electrically controlled and timed ——. Mahr 259
  - in petroleum and its distillation products; Determination of ——. Charitschkoff 1147
  - Rock —— in Utah. Bardwell and others 15, 16
- Aspirin. *See* Acetylsalicylic acid.
- Assam; Petroleum in ——. Pascoe 1042
- Assay furnaces; Crude oil for ——. Haldane 15
- Atmospheric gases; Method of obtaining rare ——. (P) Bucher, and Nitrogen Products Co. 962
- Atomiser for lead chambers. (P) Parent 311
- Atomising apparatus for purifying, washing, and cooling gases. (P) Theisen 241
  - liquids by air or gases; Appliances for ——. (P) Samuelson and Backhouse 631
- Atoxyl. Boon 1188
- Auramine; Constitution of ——. Grandmougin and Favre-Ambrumyan 827
- Auric compounds from cantharidylethylenediamine and their production:
  - (P) Spiess and Feldt 890*r*
  - (P) Meister, Lucius, und Brüning 375, 1172*r*
- Aurothiosulphuric acid; Manufacture of salts of ——. (P) Meister, Lucius, und Brüning 806, 1172*r*
- Australia; Denaturation of soya bean oil for paint making in —— 837
  - Tin resources of —— 1054
- Australian pine barks. Coombs and Dettmann 232
- Austria-Hungary; Prohibition of certain exports from —— 810
  - Trade competition with ——. Action by the Board of Trade 847, 896, 945, 946, 1037, 1077
- Austrian paraffin wax industry; Application of cold in the ——. Porges 1042
  - standards for Portland cement; Alterations in —— 1089
- Autoclave apparatus for transformation of petroleum and similar hydrocarbons. (P) Renard 345
- Auto-fermentation. Neuberg and Kerb 37
- Autoxidation of xylene and benzaldehyde on exposure to light. Suida 955
- Autoxidations by the chemical action of light:
  - Ciamician and Silber 45, 334
  - Sommerhoff 152
- Auxetic action of certain coal tar bases believed to induce pitch-cancer. Norris 741
- Azides; Explosive properties of ——. Wöhler and Martin .. 768
  - Manufacture of ——. (P) Staudinger 693
- Azine dyestuffs; Constitution and colour of ——. Kehrmann and others 687
  - Safranine dyestuffs; Derivatives of ——. (P) Act.-Ges. f. Anilinfabr. 415
- Azo dyestuffs from the arylides of 2.3-hydroxynaphthoic acid; Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron 915
  - capable of being further developed; Manufacture of ——:
    - (P) Bayer und Co. 195, 195*r*, 784, 856*r*
    - (P) Kalle und Co. 828, 915*r*, 1084*r*
  - containing the arseno group; Manufacture of ——. (P) Meister, Lucius, und Brüning 502, 503*r*
  - containing an arylsulphonic ester group; Manufacture of ——. (P) Geigy Anilinfarben u. Extractfabr. 638, 639*r*
  - for cotton; Manufacture of ——. (P) Bayer und Co. 131*r*, 131*r*, 347*r*, 416*r*
  - dyeing cotton directly; Manufacture of black ——. Act.-Ges. f. Anilinfabr. v. Levinstein. Report of Patent Case 915

PAGE

- **Azo** dyestuffs—*cont.*
  - for half-wool and half-silk; Manufacture of ——. (P) Meister, Lucius, und Brüning 194
  - Ice-colours on cotton yarns, cops, cross-reels, etc.; Production of ——. (P) Chem. Fabr. Griesheim-Elektron 73, 196*r*
  - Manufacture of ——:
    - (P) Act.-Ges. f. Anilinfabr. 247*r*
    - (P) Bayer und Co. 71, 131*r* 247, 347*r*, 348*r*, 348*r*, 414, 414, 545, 588*r*, 639*r*, 743, 743*r*, 784, 784*r*, 784*r*, 1151,
    - (P) Cassella und Co. 347, 957
    - (P) Chem. Fabr. Griesheim-Elektron 855, 855
    - (P) Geigy Anilinfarben- u. Extractfabrik. 416, 588*r*, 588*r*
    - (P) Günther and others 784*r*
    - (P) Hagemann, and Synthetic Patents Co. 1151
    - (P) Jordan and others 743*r*
    - (P) Levinstein, Ltd., and others 73, 197, 251, 545*r*, 1200
    - (P) Meister, Lucius, und Brüning 131*r*, 957
    - (P) Volkmann, and Synthetic Patents Co. 743*r*
    - (P) Zart and others 1151*r*
  - Manufacture of basic ——. (P) Bayer und Co. 347*r*
  - Manufacture of bisulphite compounds of —— and lakes therefrom. (P) Badische Anilin und Soda Fabrik .. 348*r*
  - Manufacture of diazotisable ——. (P) Bayer und Co. 195, 476*r*, 639
  - Manufacture of direct dyeing poly- ——. (P) Chem. Fabr. vorm. Sandoz 415, 476*r*
  - Manufacture of dis- —— for cotton:
    - (P) Chem. Fabr. Griesheim-Elektron 19, 195*r*, 588*r*
    - (P) Meister, Lucius, und Brüning 475
  - Manufacture of dis- —— especially for lakes. (P) Chem. Fabr. Griesheim-Elektron 195, 195*r*, 416*r*
  - Manufacture of *o*-hydroxymono- ——. (P) Meister, Lucius, und Brüning 195
  - Manufacture of mordant dis- ——. (P) Geigy Anilinfarben u. Extractfabrik 545
  - Manufacture of poly- ——. (P) Cassella und Co. 415, 743, 915*r*
  - Manufacture of substantive ——. (P) Read Holliday and Sons, and others 784*r*
  - Manufacture of substantive poly- ——. (P) Bayer und Co. 855
  - Manufacture of substantive —— which are rendered faster by after-treatment with formaldehyde. (P) Kalle und Co. 1005
  - Manufacture of tris- ——. (P) Cassella und Co. 743
  - Manufacture of violet to blue ——. (P) Bayer und Co. 19
  - from nitro-*m*-anisidines; Comparison of the —— with those from the corresponding nitranilines. Reverdin and Widmer 855
  - Para Red; Preventing oxidation of the β-naphthol in dyeing ——. Saget 309
  - Process for dyeing cotton fast shades with ——:
    - (P) Kalle und Co. 828
    - (P) Meister, Lucius, und Brüning 828
  - for wool; Manufacture of chrome ——. (P) Chem. Fabr. vorm. Sandoz 856
  - for wool; Manufacture of mono- ——:
    - (P) Act.-Ges. f. Anilinfabr. 71*r*
    - (P) Hauptmann and others 1084*r*
    - (P) Meister, Lucius, und Brüning 416, 416
    - (P) Mersey Chemical Works, Ltd., and Ackermann 19
  - for wool; Manufacture of dis- ——. (P) Bayer und Co. 195
- *bis*-Azophenolphthalein; Constitution of ——. Oddo 414
- Azoxine dyestuffs; Constitution and colour of ——. Kehrmann and others 687
- Azoxy compounds; Certain ——. Reitzenstein and Fitzgerald 956

B

- ***B. coli*** **in water**; Detection and significance of ——. Plücker 1110
- **Bacteria**; Action of eosin on ——. Zeiss 1111
  - Escape of —— into the air by the spraying of polluted water. Cavel 435
  - in milk; Comparison of the microscopical method and the plate method of counting ——. Brew 708
  - Preparation of efficacious inoculating substances from ——. (P) Kalle und Co. 889
  - Reduction of nitrates to nitrites and ammonia by ——. Klaeser 877
  - resistant to calcium hypochlorite; Study of some ——. Thomas 804
  - Search for pathogenic —— in river water and sewage. Houston 980
  - in water; The decomposing power of ——. Spät .. 1070
- Bacterial action in soils as a function of food concentration and of insoluble organic matter. Rahn 560
  - preparations for treating gonorrhœal diseases. (P) Warden 1226
- Bactericidal action of lanthanum and thorium salts on the cholera vibrio. Frouin and Roudsky 942
  - and physico-chemical action of neutral salts; Relation between the ——. Berczeller 884

PAGE
Bagasse carbon; Use of —— for decolorising in white sugar manufacture. Clacher 271
  Utilisation of ——. Deerr 934
  Weight of —— in sugar factory control. Spencer .. 705
Bag-house in lead smelting: Use of the ——. Anderson 967
Baker's yeast. *See under* Yeast.
Baking; Manufacture of highly active extracts for use in ——. (P) Hamburg 803
  powder. (P) Boehringer Sohn 99
  preparations:
    (P) Holbrook, and Victor Chemical Works 1109
    (P) Victor Chemical Works 1218
  purposes; Inorganic enzymes and their use for ——. (P) Weil 802
  salt. (P) Berry and Schaumlöffel 483
Baku petroleum oil; Naphthenic acids of high molecular weight in ——. Pyhälä 739
Balance sheet of the Society, Dec. 31, 1913 620
Balance-spring having elasticity increasing with a rise in temperature. (P) Guillaume, and Soc. des Fabriques de Spiraux Réunies 925
Balloon envelopes; Manufacture of fabrics for ——. (P) Liais 957
  fabrics. National Physical Laboratory Report 893
Balloons; Fabrics for spherical and dirigible ——. (P) Porritt, and North British Rubber Co., Ltd..... 132
Balsam fir as a pulp wood 745
  of Peru; Artificial and genuine ——. Dieterich 159, 565
  Peru; Essential oil obtained by steam distillation of ——. Sortell 565
Bamboo; Production of paper pulp or cellulose from ——. (P) Jardine and Nelson 1006
Bandages; Preparation of aseptically sterile ——. (P) Graf 43
Barbaloin; Conversion of —— into β-barbaloin. Léger .. 765
Barbey's viscometer; Comparison of —— with Engler's instrument. Baheux 1146
Barbier-Grignard reactions; Some ——. Kyriakides 502
Barium aluminate as a mordant for cotton; Use of ——. Grenot. Report by Battegay 641
  aluminate; Preparation of ——. (P) Beringer 830
  amide and imide. Dafert and Miklauz.............. 21
  borates. The system, BaO,B_2O_3,H_2O, at 30° C. Sborgi 748
  chloride solutions; Electrolysis of —— with mercury cathodes. Fedotieff 419
  compounds; Treatment of radioactive ——. (P) McCoy 919
  hydroxide; Manufacture of ——. (P) Newberry and Barrett 962
  nitrate: Solubility of ——. Stability of barium-potassium nitrate. Findlay and others 419
  oxide; Manufacture of ——:
    (P) Akers 1154
    (P) Saunders 1088
Bark; Extraction of tannin from —— and apparatus therefor. (P) Bilbrough and Frew 840
Barley; Determination of the amino-acid and polypeptide nitrogen in ——. Adler 367
  Direct determination of extract as a factor in the valuation of brewing ——. Seibriger 97
  Influence of potassium and phosphoric acid on the quality of brewing ——. Schül 760
Barometers; Mercurial ——. National Physical Laboratory Report 893
Barosma Venusta; Volatile oil from the leaves of ——. Goulding and Roberts 1222
Barytes in Canada 1046
  Separation of —— from ores and minerals. (P) Greenstreet 31*r*, 312, 750*r*
Base-exchanging substances; Manufacture of ——. (P) Permutit A.-G.................... 549, 831*r*
Bases; Displacement-curves of some organic ——. Gonbau 805
  of gas-works coal tar believed to induce pitch cancer, and a method for rendering them inactive. Auxetic action. Norris 741
  Manufacture of double compounds of organic —— with gold salts. (P) Meister, Lucius, und Brüning .. 1036
  from tar or tar oils; Increasing the fungicidal and insecticidal properties of the nitrogenous ——. (P) Chem. Fabr. Flörsheim Dr. H. Noerdlinger .. 1025
Bassia butyracea fats. Diedrichs 1098
Bassia latifolia from Mauritius; Fat of —— 147
Battelle process of sugar recovery. Norris 154
Bauxite; Manufacture of polishing material from ——. (P) Strasser 354
  production in the United States in 1913. Phalen 96
  Thermal analysis of ——. Wohlin 78
Bearing metals; Investigations on ——. Heyn and Bauer 1094
Beating engines for paper making, etc. (P) Marx 20, 20, 916*r*
Beef fat in lard; Detection of ——. Bömer 38, 323
  fat in lard; Detection of —— by Bömer's method. Sprinkmeyer and Diedrichs 563

Beer casks; Treatment of the interior of ——. (P) Wicküler-Kupper Brauerei A.-G.................... 936
  Colorimetric determination of acids in ——. Lüers .. 761
  Concentration of hydrogen ions in ——. Emslander 212
  containing iron; Manufacture of ——. (P) Narjes .. 659
  Determination of alcohol in —— by Malligand's ebullioscope. Cain 156
  Determination of amino-acid and polypeptide nitrogen in ——. Adler 367
  Determination of colloids in ——. Marc 562
  The ebullioscope in determination of original gravity of ——. Pope 496
  Manufacture of ——. (P) Seize 370
  Manufacture of non-alcoholic ——:
    (P) Kroupa 497
    (P) Kroupa and Bochmann 609*r*
  Method and apparatus for clearing ——. (P) Curtis and Huxley 707
  Method and apparatus for treating and bottling ——. (P) Robbins 563
  Pasteurising, sterilising, and cooling ——. (P) Gregory 1105
  Process of charging ——. (P) Lamsens 330*r*
  Rate of fermentation of priming solutions when added to ——. Baker and Hulton 562
  Report of Government Laboratory on —— 892
  Sterilising and purifying —— and apparatus therefor. (P) Shelmerdine and Lewis 37
  Temperature corrections to be applied to the specific gravity of ——. Day and Amos 434
  Torula producing a pine-apple flavour in ——. Moritz 761
  turbidity due to calcium fluoride. Will 892
  wort; Apparatus for extracting ——. (P) Ramsden 659, 708
  wort; Assimilable nitrogen in —— and its relation to the yeast and fermentation. Schönfeld 658
  wort boiling; Chemistry of pressure ——. Moufang 761
  wort; Colorimetric determination of acids in ——. Lüers 761
  wort; Mash-filter for separating —— from grains. (P) Rath 563
  wort; Process for transferring oxygen, bacteria, aromatic substances, etc., to ——. (P) Schulze 802
  worts; Influence of temperature on saccharometer readings in ——. Rossi 977
  yeast. *See under* Yeast.
Beers; Chilled bottle ——. Hadley 1104
Beeswax; Bleaching of ——. Heinz 1098
  Indian, Japanese, and Chinese ——. Fischer 90
  Use of ozonised air to whiten —— 651
Beetroot; Action of manganese and boron compounds on the cultivation of the sugar ——. Pellet 153
  Culture of the sugar —— in England 1217
  Determination of sucrose and reducing sugars in the foliage of the ——. Pellet 1102
  distilleries; Methods of purification of vinasse from ——. Müntz and Lainé 213
  Evolution of sugar in the —— during its second period of vegetation. Levallois 704
  Excessive leaf growth of the ——. Vivien 211
  factory at Kidderminster; Proposed sugar —— 1023
  Fertilisation of the sugar —— with magnesia. Strohmer and Fallada 1216
  Formation and disappearance of sugar in the ——. Cassel 366
  Formation of sugar in the ——:
    Colin 1217
    Pellet 1102
  juice; Analysis of a precipitate from the sulphitation of intermediate ——. Kiroff 656
  juice; Direct determination of the Brix (dry substance) of ——. Pellet 1165
  juice; Fermentation of —— to increase the yield of alcohol. (P) Martinand 329
  juice; Purification of —— by alumina. Lindner 96
  leaves as cattle food. Hitier 273
  Localisation of potash in the sugar —— and its physiological significance. Matonsek 366
  plant; New constituents of the sugar —— and their biological detection. Kobert 937
  Preliminary treatment of sugar —— to obtain juice. (P) Lindner 607
  Preparation of sugar —— for extraction of juice. (P) Lindner 212
  products; Detection of raw —— in admixture with raw cane products. Ling 433
  Relation between the weight and sucrose content of the —— and the surface of the soil. Pellet 1217
  seed; New German standards for the trade in ——. Edler 976
  slice dryers; Explosions in ——. Albrecht 433
  slices; Apparatus for lixiviating ——. (P) Möhring .. 841
  slices; Heat lost in drying ——. Janak 878
Belgium; Acetic acid for industrial purposes in —— 829
  Prohibition of certain exports from —— 809
Belladonna leaves; Adulteration of ——. Allen and Deane 843
  plant; Alkaloids in ——. Sievers 373
  plants; Individual variation in the alkaloidal content of ——. Sievers 40
  seed; Germination of ——. Sievers 1170

Bemrose and Sons; Visit to the printing works of ——. Annual meeting 725
Bengal beans, a new fodder. Shrewsbury 937
  Pitchblende in ——. Burton 1055
Benzalcumaranones; Conversion of —— into flavonols. Von Auwers and Pohl 827
Benzaldehyde; Autoxidation of —— by exposure to light. Suida 955
Benzanthrone series; Manufacture of acridones and thioxanthones of the ——. (P) Badische Anilin und Soda Fabrik 415
  series; Manufacture and use of dyestuffs of the ——. (P) Badische Anilin und Soda Fabrik 194, 248*r*, 348*r*
Benzene; Bromination of —— and its homologues. Catalytic action of manganese. Gay and others 742
  Chlorination of —— by means of *aqua regia*. Datta and Fernandes 1198
  Continuous rectification of —— and apparatus therefor. (P) Barbet 954
  Determination of the total sulphur in commercial ——. Schenk 130
  and formic acid; Mutual solubility of ——. The system, benzene, formic acid, water. Ewins 333
  The freezing point of —— as a fixed point in thermometry. Richards and Shipley 1036
  in illuminating gas; Apparatus for the determination of ——. (P) Soc. Roubaisienne d'Eclairage par le Gaz et l'Electricité, and Forrières 129
  nitrating apparatus; Explosion of a cast-iron ——. Pikos 586
  Nitro compounds of ——. Will 376
  from petroleum and its distillates; Preparation of ——. (P) Holcgreber 17, 825*r*
Benzene derivatives in soils; Presence of some ——. Shorey 432
Benzine; Accidents caused by —— in 1913. Chem. Fabr. Griesheim-Elektron 1110
  Electrification of ——. Dolezalek 1147
  from natural gas. Biluchowski and von Pilat 1147
  Process and apparatus for refining ——. (P) Beer .. 129
Benzoic acid; Catalytic decomposition of ——. Sabatier and Mailhe 941
  Extraction of —— from aqueous solutions. Marden .. 501
  in milk and cream; Detection and determination of ——. Hinks 37
  Quantitative study of the sulphonation of ——. Maarse 1084
  Test for halogens in ——. Weude 276
Benzoin; Analytical characters of gum ——. Cocking and Kettle 843
Benzol; Production of high-grade, pale coumarone-resin from heavy ——. (P) Wendriner 474
  refining; Purification of waste sulphuric acid from ——. (P) Gasser 587
Benzo-nor-*p*-menthane; Synthesis of derivatives of ——. Kay and Morton 1027
Benzoyl in benzoyl derivatives; Determination of ——. Van der Haar 984
Benzoylcarbinol from phenylglyoxal; Formation of —— by the action of fermenting yeast. Dakin 706
Benzoyl peroxide as a reagent for displacing sulphur. Vamino and Schinner 941
Benzyl alcohol; Preparation of —— from benzyl chloride. (P) Klever 277, 277, 613*r*
Benzyl chloride and its homologues; Preparation of ——. (P) Fabriques de Produits de Chimie Organique de Laire 503
Benzyl esters of lower fatty acids; Preparation of ——. (P) Klever 277, 375*r*
Benzyloxanthrone. Tschilikin 956
Berberine and its determination. Richter 764
Berlin; Safety petrol-store in the Osthafen, ——. Rosenthal 343
Beryllium and uranium; Separation and determination of ——. Wunder and Wenger 615
Beryllium oxalate and acetate. Wirth 592
  oxide and carbide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  sulphate and its hydrates. Taboury 1087
Betaine; Action of micro-organisms on ——. Ehrlich and Lange 273
  Decomposition of —— by caustic potash. Albers .. 36
  ferrocyanide and ferricyanide. Roeder 41
  hydrochloride from molasses residues; Preparation of ——. Stoltzenberg 97
Beverage from dairy residues; Preparation of a salutary ——. (P) Jolles 842*r*
  and its salts; Manufacture of —— from molasses, exhausted molasses, etc. (P) Act.-Ges. f. Anilinfabr. 658, 935*r*
  salts; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 43*r*, 767
  extract. (P) Post, and Postum Cereal Co. 803
Beverages; Determination of total solids in fermented ——. Malvezin 272
  Manufacture of fermented ——. (P) Kuhn 659
  Manufacture of non-alcoholic ——. (P) Wagner 214*r*
  Manufacture of powdered extracts for use in making ——. (P) Kellogg 803

Beverages—*cont.*
  Method and apparatus for treating and bottling alcoholic ——. (P) Robbins 563
  Production of "frosted" ——. (P) Wegener 157
Bi-metallic plates, sheets, etc.; Manufacture of ——. (P) Soc. Internationale de Métallurgie Nouvelle 426
Binders for fuel and other briquettes; Manufacture of ——. (P) Davis and others 1196
Binding medium from waste sulphite lyes; Manufacture of a ——. (P) Müller 478
  substance from sulphite pulp spent lyes; Preparation of a ——. (P) Pollacsek 248, 746*r*
Biological action of chemical reagents; Cause of error in studying the ——. Javillier 164
Bioritsu, Formosa; Study of the crude petroleum from ——. Katayama 683
Birch barks; Valuation of —— by von Schroeder's hydrometer method. Appelius 840
Birkin and Co.'s lace works; Visit to ——. Annual Meeting 724
Biscuit bakeries; Production of lactic acid from waste dough of ——. (P) Saxe 274
Biscuits; Manufacture of ——. (P) Dunham 660
Bismuth and cerium; Alloys of ——. Vogel 85
  Separation of —— from copper. (P) Thum, and United States Metals Refining Co. 794
  -tin-tungsten ores; Treatment of ——. Hills 967
Bismuth-arsenic compounds; Preparation of organic ——. (P) Meister, Lucius, und Brüning 375
  compounds with organic substances; Action of magnesium salts on complex ——. Quartaroli 591
  gallocarboxylate; Preparation of basic ——. (P) Bayer und Co. 277, 614*r*, 767*r*, 890
  subnitrate; Detection of lead in ——. Guérin 748
Bismuthated oil of vaseline. Vicario 1115
Bismuthinitrites. Ball and Abram 75
Bisulphates; Conversion of —— into sulphuric acid and normal sulphate. (P) Metallbank u. Metallurgische Ges., and Klencke 788
Bisulphites; Manufacture of ——. (P) Friedrich and Hirsch 422*r*
  Process of stabilising ——. (P) Nonnet 354*r*
Bitumen macadam. (P) Ingham 26
Bitumens; Detection of petroleum pitch in liquid ——. Halphen and Spiess 189
Bituminous compositions. (P) Ingham 201
  material; Treatment of ——. (P) Ross, and The Hydrocarbon Co. 911
  materials; Process for increasing the heat-resisting properties of ——. (P) Zimmer 130*r*
  material; Process for mixing —— with stone or sand by application of heat. (P) Kaye, and British Silicate Engineering Co. 583
  matter; Continuous fractional distillation of ——. (P) Aarts 412, 474*r*
  rocks of Estland and their decomposition products; Composition of the ——. Fokin 1082
Black dyeings on cotton; Production of fast ——. (P) Meister, Lucius, und Brüning 828
Blast; Economy of dry ——. Von Ehrenwerth 82
  -furnace coke:
    Koppers 1042
    Simmersbach 1042
  -furnace dust; Process for briquetting ——. (P) Mathesius 85
  -furnace dust; Recovery of iron and other metals from ——. (P) Billard 488
  -furnace flue dust; Utilisation of iron ——. (P) Baggaley 85
  -furnace gas; Cleaning and utilisation of ——. Johnson 1144
  -furnace gas; Purification of ——. (P) Schwarz 411
  -furnace gas purification; Development of dry-cleaning in ——. Müller 553
  -furnace gases; Purifying —— by water spraying and cooling. Bayer 1094
  -furnace gases; Purification of ——. (P) Schwarz .. 472
  -furnace gases; Use of dust recovered in purifying —— as binding agent in briquetting ores and flue-dust. Kippe 1094
  -furnace slag. *See under* Slag.
  -furnace stoves; New process for heating ——. Spannagel 1010
  furnaces. *See under* Furnaces.

- Briquettes of carbonaceous material; Manufacture of —— with aid of waste sulphite lye. (P) Richter 1043
  - of coal and carbonaceous waste; Manufacture of ——. (P) Naamlooze Vennootschap Briquet Co. 825*r*
  - from coke dust; Manufacture of ——. (P) Alexander 67, 1197*r*
  - Manufacture of ——:
    - (P) Fohr and Kleinschmidt 191*r*, 636*r*
    - (P) Platsch 129*r*
    - (P) Reynolds 909
  - Manufacture of fuel and other —— and binders therefor. (P) Davis and others 1196
  - Rhenish lignite —— in domestic and industrial use. Oellerich 1081
  - from waste wood; Manufacture of ——. (P) Eckstein and Wislicki 635
- Briquetting coal and lignite by means of a mixture of pitch and tar oils. (P) Moreau 635
  - coal with waste sulphite-cellulose lyes. (P) Grätz 471
  - fuel by means of dry paper pulp flock; Process for ——. (P) Reinold 17*r*, 191*r*
  - iron ore and the like; Process for ——. (P) Crusius 488, 600*r*
  - iron ores or blast-furnace dust; Process for ——. (P) Mathesius 85
  - machines. (P) Korte 1080
  - ores and flue-dust using as binding agent the dust recovered in purifying blast-furnace gases. Kippe 1094
  - peat; Process for ——. (P) Prioleau and Prioleau 303
  - plant; Apparatus for removing and utilising dust in ——. (P) Fischer 16
  - Preparation of pulverulent materials for ——. (P) Zwoyer, and Zwoyer Fuel Co. 243
- British Empire; Oil resources of the ——. Perkin 491
- British Honduras; Cohune nuts from —— and their products 972
- British Pharmacopœia, 1914; Analytical processes of the ——. Umney 1222
  - Essential oils of the —— 1071
  - Fixed oils of the —— 1062
- British dyestuff industry 1200
  - trade; Openings for —— in various countries 946
- Bromides; Detection of —— in presence of thiocyanates and ferrocyanides. Guareschi 748
- Bromination of benzene and its homologues; Catalytic action of manganese in the ——. Gay and others 742
- Bromine; Apparatus for the production of ——. Kubierschky 135
  - associated with chlorine in haloid salts; Use of telluric acid in the determination of ——. Gooch and Cole 352
  - in haloid salts; Determination of —— by means of telluric acid. Cole 1007
  - and manganese; Combination of —— in presence of ether. Ducelliez and Raynaud 310
  - Recovery of —— from gases containing it. (P) Schaefer 313
- Bromine hydrate. Giran 919
- β-Bromo-aminoanthraquinones; Preparation of ——. (P) Bayer und Co. 783
- 3-Bromo-2-aminoanthraquinone; Preparation of ——. (P) Junghans 783
- Bromodialkylacetamide; Preparation of derivatives of ——. (P) Meister, Lucius, and Brüning 668
- Bromodiethylacetyl isocyanate. (P) Hefti, and Bayer und Co. 439
- α-Bromo-isovaleryl-*p*-phenetidine; Preparation of ——:
  - (P) Bergell 1115
  - (P) Riedel A.-G. 567
- α-Bromo-isovalerylurea; Preparation of ——. (P) Knoll und Co. 806
- α-Bromo-isovalerylurea acetylsalicylate; Preparation of ——. (P) Knoll und Co. 806
- α-Bromonaphthalene: its physical properties and application to the determination of water in moist alcohol. Jones and Lapworth 888
- Bronze. Dewrance 316
  - Analysis of ——. Bertiaux 142
  - Determination of phosphorus in phosphor- ——. Hagmaier 923
  - Determination of zinc in coinage —— by volatilisation. Rose 170
  - Effect of acid solutions on ——. Croasdale 1212
  - foil; Manufacture of ——. (P) Genthiner Cartonpapierfabrik 869
  - Manufacture of manganese- ——. (P) Heusler, and British Mining and Metal Co., Ltd. 205
  - Nickel —— coinages of the world to the end of 1912 1157
  - Pyrometers for molten ——. Gillett 967
  - Standard test bars of the zinc ——, 2Zn,10Sn,88Cu. Karr 1012

PAGE

Bronzes; Analysis of ——. Schenck 29
  Attempts to produce zirconium-, aluminium-, antimony-, and chromium- ——, electrolytically. Kremann and others 752
  Electrolytic separation of copper-tin —— and their investigation. Kremann and others 553
  Three-metal ——. Blow 833
Brown prints on vegetable fibre; Production of fast ——. (P) Meister, Lucius, und Brüning 480, 642
  shades on fibre; Production of ——. (P) Badische Anilin und Soda Fabrik 481r
  shades on vegetable fibres; Process for dyeing ——. (P) Levinstein, Ltd., and others 73, 828r
Brucine; Some new oxidation products of ——. Leuchs and Rauch 100
  and nitric acid; Interaction between —— in presence of metallic nitrates. Rennie and Dawkins 764
Buchu camphor; Synthesis of ——. Cusmano 101
Bucking; Composition suitable for ——. (P) Badische Anilin und Soda Fabrik 590r
Building blocks from domestic and other refuse; Manufacture of ——. (P) Becker and Unger 647
  composition and its manufacture. (P) De Caudemberg 751r
  Manufacture of fat lime for use in ——. (P) Filleux 655
  stone; Porosity of ——. Campbell 1156
Bullion; Determination of silver and base metal in precious metal ——. Dewey 966
Bunsen flame; Influence of secondary air on the inner cone of the ——. Ubbelohde and Dommer 853
Burmese lacquer, Thitsi. Rosenthal 703
Burner for pulverised coal; The Dunn ——. Roush 65
Burner-gases; Method of separating water from ——. (P) Herreshoff, and General Chemical Co. 1207
Burning finely divided fuel; Method and apparatus for ——. (P) Irish, and Babcock and Wilcox Co. 304r, 304r, 824r
  liquid fuels; Methods of ——. (P) Doherty 824
  solid fuel; Process for ——. (P) Evans, and United Gas Improvement Co. 303
Bustenari petroleum and its derivatives; Products of destructive distillation of crude ——. Petroni 1195
Butadiene and its homologues; Manufacture of ——. (P) Perkin and Matthews 221r, 806
1.3-Butadiene hydrocarbons; Process for preparing ——. Kyriakides 612
Butine; Preparation of pure ——. Picon 616
Butte-Duluth mine; Leaching of oxidised copper ores by modified Dorr classifiers at the ——. Herzig .. 596
Butter; Adulteration of —— by coconut oil, and presence of coconut oil in genuine butter. Ledent 98
  Apparatus for determining water in —— by weighing. (P) Altmann 937
  fat content of margarine. Arnold 1106
  fat; Detection of coconut oil in ——. Barthel and Sondén 498
  fat; Detection of lard in ——. Bömer 323
  fat; Rapid method of determining —— gravimetrically. König 370
  -milk which can be preserved for a long time; Preparation of ——. (P) Suwelack 763
  Preservation of —— by means of sodium bicarbonate and nitrate. Bordas 214
  Production of renovated and artificial ——. (P) Heller, and Beatrice Creamery Co. 1024
  Purification of ——. (P) Higgins 498
  Rapid determination of fat in ——. Kropat 498
  suitable for long storage; Process for obtaining ——. (P) Zmeskall 98
  Water content of ——. Theopold 1106
1.3-Butyleneglycol; Preparation of ——. (P) Bayer und Co. 613r
By-products from distillation gases; Apparatus for recovering ——. (P) Aarts 17

C

Cable insulation; Action of copper and other metals on ——. Frank and Marckwald 653
Cables; Apparatus for impregnating and coating ——. (P) Destribats 133
Cacao beans; Process and apparatus for treating ——. (P) Watt 979, 979
  beans; Treatment of —— in the manufacture of chocolate, cocoa, and cocoa preparations. (P) Vignes 660
  butter; New adulterant of ——. Grimme 972
  powder; Preparation of easily soluble —— without the use of chemicals. (P) Bergmüller 609r
Cadier; Essential oil from the wood of ——. Huerre 940
Cadinene from *Daniella thurifera*. Lenz 765

Cadmium; Electrodeposition of ——. Mathers and Marble 1012
  Physico-chemical studies on ——. Cohen and Helderman 597
  -zinc alloys; Hardness and electrical conductivity of ——. Glasunow and Matweew 142
Cadmium-ammonium sulphates. Veres 74
  salicylate. De Coninck 844
Caesium nitrite. Ball and Abram 75
Caffeine in coffee; Determination of ——. Fendler and Stüber 802
  and tannin; Separation of —— by extraction. Marden 501
Calamus oil. Semmler and Spornitz 40
  Constituents of ——. Thoms and Beckstroem 101
Calcining furnaces. (P) Cornet 540, 835
  kilns or ovens for lime, cement, etc. (P) Crosland and Booth 833
  ores and like material. (P) Weeks, and Dwight and Lloyd Sintering Co. 755r
Calcite which becomes phosphorescent when heated. Pisani 1118
Calcium; Absorption of nitrogen by ——. Brandt 749
  and magnesium; Analytical separation of ——. Halla 161
  Mechanical precipitation in the determination of ——. Ledoux 335r
Calcium acetate; Production of —— by hardwood distillation in the United States. Palmer 345
  acid phosphate; Manufacture of ——. (P) Reed 976
  -aluminium silicate, $8CaO.Al_2O_3.2SiO_2$; The ——. Kühl 315
  amide and imide. Dafert and Miklauz 21
  carbide; Application of —— in the formation of alloys. Hodgkinson 445
  carbide; Process for coating —— with calcium cyanamide. (P) Imperatori and others 77r
  carbide; Process for crushing and grinding ——. (P) Landis, and American Cyanamid Co. 788
  carbide; Shipments of ——. Prohibition withdrawn 1174
  carbonate from causticising plant; Composition and agricultural value of waste ——. Hendrick 122
  carbonate, magnesium carbonate, carbonic acid, water; The system ——. Leather and Sen 1007
  carbonate slimes containing ammonium sulphate; Extraction of ammonia from ——. (P) Badische Anilin und Soda Fabrik 645
  carbonate; Solubility of —— and its bearing on the treatment of water supplies. Burgess 158
  casein; Preparation of ——. (P) Hoffmann-La Roche und Co. 374
  citrate; Manufacture of ——. (P) Rose and Co., Ltd., and Rose 136
  cyanamide; Action of carbon dioxide on crude ——. Manuelli 933
  cyanamide; Apparatus for producing ——. (P) Weaver 593
  cyanamide; Behaviour of some mould fungi towards ——. Kossowicz 1100
  cyanamide; Continuous production of ——. (P) Dettifoss Power Co., Ltd., and Lidholm 644, 920r
  cyanamide; Explosion of acetylene from —— in Trieste Harbour. Morpurgo 482
  cyanamide; Manufacture of ——:
    (P) Dreaper 788
    (P) Lidholm, and Dettifoss Power Co., Ltd. 256, 593r, 644, 962, 962r
  cyanamide; Manufacture of a fertiliser from crude ——. (P) Ungnade and Nolte 270
  cyanamide; Method and apparatus for granulating ——. (P) Sinclair 933
  cyanamide powder; Process for agglomerating ——. (P) Goris and Vischniac 655
  cyanamide; Preparation of ammonia from ——. Manuelli 690
  cyanamide; Presence of nitride in ——. Manuelli .. 420
  cyanamide; Process for rendering —— non-dusting. (P) Washburn 800
  cyanamide and sodium nitrate; Fertilising effect of a mixture of ——. Bolin 1216
  cyanamide; Solubility of the nitrogen compounds of —— in water. Manuelli 690
  cyanamide; Technical methods of converting —— into dicyanodiamide, from the standpoint of chemical kinetics. Grube and Nitsche 749
  glycerophosphate of commerce; Composition of ——. Umney and Bennett 844
  hydride; Thermo-dynamics of the formation of ——. Brönsted 1013
  hydroxide. Seliwanow 252
  hydroxide with phenol; Compounds of ——. Seliwanow 1198
  hydroxide and sulphur; Reaction between —— in aqueous solution. Tartar 351
  hypochlorite treatment of a municipal water supply, and study of some resistant bacteria. Thomas 804
  hypochlorite treatment of water. Klut 1069
  lactate; Preparation of an acid ——. (P) Chem. Werke vorm. Dr. H. Byk 503
  -magnesium carbonate in a voluminous form; Production of ——. (P) Bindschedler 136
  nitrate and cyanamide; Determination of nitrogen in mixtures of ——. Stutzer 606
  nitrate; Determination of nitrogen in ——. Busvold 748

  Manufacture of trimethylamine derivatives for use in making ——. (P) Herzmann ... 838
  Manufacture of wicks for ——. (P) Wilson ... 477
Cane juice; Use of dicalcium phosphate and kieselguhr for clarifying —— in Brazil. Pellet ... 705
  juices; Investigations on the lime content of ——. Cross ... 606
  juices; Sulphitation and carbonatation processes for clarifying Louisiana ——. Cross ... 656
  juices and syrups; Analysis of ——. Fribourg ... 655
  juices; Treatment of ——. (P) Guerrero ... 496r
  molasses; Origin of the reducing sugars in ——. Pellet 495
Cannels: Production of oils from ——. (P) Rollason ... 345
Cantharidin. Gadamer ... 1112
  compounds for use in treating tuberculosis; Manufacture of ——. (P) Meister, Lucius, und Brüning 375, 375r, 568
Cantharidylethylenediamine; Preparation of auric compounds from ——:
    (P) Spiess and Feldt ... 890r
    (P) Meister, Lucius, und Brüning ... 375, 1172r
Canvas: Apparatus for waterproofing or applying rubber to ——. (P) Higham and Skelton ... 1063
Caoutchouc; Addition reactions of ——. Kirchhof ... 150
  Diacetylpropane (1.5-heptanedione) from ——. Harries 364
  Manufacture of substances resembling ——:
    (P) Badische Anilin und Soda Fabrik 93, 94r, 365 605r, 758r
    (P) Bayer und Co. ... 94r, 151r, 209, 269r, 1100r
    (P) Chem. Fabr. Flörsheim Dr. H. Noerdlinger 269r
  Manufacture of synthetic ——:
    (P) Gross ... 151r, 431r
    (P) Heinemann ... 209r
    (P) Matthews and Strange ... 1063
  Manufacture of vulcanised ——. (P) Bayer und Co. 94, 151r
  Process for improving the properties of synthetic ——. (P) Ephraim ... 758
  solutions; Osmotic properties and physical constitution of ——. Caspari ... 932
  substances; Accelerating the vulcanisation of natural or artificial ——. (P) Bayer und Co. 94, 326r, 365, 493r, 758r
  substances; Production of coloured ——. (P) Bayer und Co. ... 1100r
  Synthetic ——. Andrejew ... 876
  Synthetic —— from isoprene:
    Harries ... 325
    Steimmig ... 267, 430
  Vulcanisation of products resembling or related to ——. (P) Badische Anilin und Soda Fabrik ... 269
Cap-compositions which do not cause rusting in rifle barrels. Mertens ... 278
Cape port wine. Kickton and Murdfield ... 658
Carabao's milk; Composition of ——. Dovey ... 98
Caramel; Colouring agent for use in making ——. (P) Ungemach A.-G. Els. Conserven-Fabrik u. Import-Ges. ... 879
  Detection of —— in wine, vinegar, brandy, etc. Schenk 369
  Determination of traces of iron in ——. Eastick and others ... 154
Caramelising of brewers' worts. (P) Ramsden ... 273
Carane. Semmler and Feldstein ... 275
Carat; The metric —— ... 444
Carbamic ester of α-dichlorhydrin; Manufacture of the ——. (P) Beckmann, and Dr. Bruno Beckmann Chem. Fabr. ... 439, 985r
  esters; Preparation of ——. (P) Bayer und Co. ... 375
Carbazole derivatives of the anthraquinone series. Ullmann and Illgen ... 246
  derivatives; Manufacture of ——. (P) Cassella und Co. 18
Carbazoles and phthalic anhydride; Condensation products from ——. (P) Badische Anilin und Soda Fabrik 415
Carbide. *See under* Calcium carbide.
Carbides; Behaviour of certain —— at high temperatures. Tiede and Birnbräuer ... 753
  Manufacture of nitrogen compounds from ——:
    (P) Krauss and others ... 549
    (P) Lidholm, and Dettifoss Power Co., Ltd. ... 644
  Production of liquid hydrocarbons from ——. (P) Plauson ... 244
  of uranium and thorium; The gaseous mixtures produced by the action of water on ——. Lebeau and Damiens ... 548
Carbohydrate esters; Production of dissolved ——. (P) Weedon, and du Pont de Nemours Powder Co. .. 132r
  phosphoric acid esters; Preparation of ——. (P) Carlson ... 103r
Carbohydrates; Determination of —— by a picrate colorimetric method. Dehn and Hartman ... 271
  Oxidation of —— by means of potassium persulphate. Wood and Walker ... 561
  Process for dissolving ——. (P) Contant and Perrot 877

Carbohydrates—*cont*
Production of ω-hydroxy-δ-methylfurfuraldehyde from —— and its influence on the determination of pentosans and methylpentosans. Cunningham and Dorée 1024
such as starch or dextrin ; Manufacture of ethers of ——. (P) Lilienfeld 958
from wood or other cellulose material ; Manufacture of ——. (P) Classen 761*r*
Carbon ; Agglomeration of powdered —— to produce articles for electrical and other purposes. (P) Comp. Franç. de Charbons pour l'Electricité 850
in aliphatic substances ; Volumetric determination of —— in the wet way. Grey 1036
Apparatus for graphitising ——. (P) Héroult, and Electrode Co. of America 200
in bituminous pyrites ; Determination of ——. Lepsöe 134
Colloidal —— obtained by a chemical method. Sabbatani 692
Conversion of —— into hydrocarbons and their halogen derivatives. (P) Tischenko and Plauson 412
for decolorising in white sugar manufacture ; Use of bagasse ——. Clacher 271
Determination of —— by the wet method, and simultaneous determination of halogens. Thies 223
electrodes for arc lamps. (P) Conradty 913, 913*r*
electrodes with protective coverings ; Production of ——. (P) Ges. f. Teerverwertung 362*r*
Free —— in tar products. Its nature and determination. Weiss 474
Heat resistivity of ——. Richards 352
in iron and its alloys ; Rapid method for the determination of ——. Szász 994
in iron and steel ; Determination of —— by the barium carbonate titration method. Cain 696
in iron and steel ; Determination of —— by direct combustion in oxygen. Cain and Cleaves 966
in iron and steel ; Direct determination of ——. Brown 696
Latent heat of vaporisation of ——. Hering 908
Manufacture of ——. (P) Soc. Anon. des Combustibles Industriels 1004
Regeneration of decolorising- ——. (P) Wijnberg 853
in soils and soil extracts ; Determination of ——. Ames and Gaither 800
in steel ; Determination of —— by the direct combustion method. Brady 1053
Carbon bisulphide as a laboratory solvent. Vlies 222
in official pharmacy, and suggestions for its further use. Alcock 843
Carbon dioxide ; Absorption of —— from the air by chromium hydroxide. Iovitchitch 420
dissolved under pressure ; Electrolytic reduction of ——. Fischer and Prziza 199
in flue gases ; Apparatus for determining the percentage of ——. (P) Schauli 987
gauge. (P) Cunningham 1077
from lighting or heating gas ; Separating and utilising the ——. (P) Athion Ges. 244
and nitrogen ; Process for obtaining ——. (P) Nitrogen Ges. 962
Preparation of liquid —— by compression and cooling. (P) Hirschlaff 137
snow ; Trichloroacetic acid as a substitute for ——. Sommer 711
Temperature of freezing mixtures containing solid ——. Thiel and Caspar 163
Titration of small quantities of ——. Dorner 104
Carbon monoxide ; Absorption of —— by refined copper. Stahl 1158
in air ; Determination of ——. Sianatt and Cramer 499
and air ; Dilution limits of inflammability of mixtures of ——. Coward and Brinsley 851
from blood ; Apparatus for extracting ——. Nicloux 158
Determination of ——. Graham and Winmill 944
Determination of —— by means of yellow mercuric oxide. Moser and Schmid 442
dissolved under pressure ; Electrolytic reduction of ——. Fischer and Prziza 199
Laws of absorption of —— by blood *in vitro*. Nicloux 99
Laws of absorption of —— by blood *in vivo*. Nicloux 274
in lighting and heating flames ; Quantity of ——. Terres 825
Manufacture of —— together with hydrogen or hydrogen and nitrogen. (P) Brownlee and others 1002
in mine air ; Methods of determining ——, and a suggested method for removing it from air. Harger 1081
Reaction of —— with alkalis. Haber 51
Reduction of —— by hydrogen under the influence of radium emanation. Scheuer 748
Carbon sulpho-selenide. Stock and Willfroth 224
Carbon sulpho-telluride. Stock and Praetorius 223
Carbon tetrachloride ; Absorption of ultra-violet rays by ——. Massol and Faucon 1115
package. (P) Harrison 942
Use of —— for extracting and determining the active principles of drugs and medicinal plants. Gori 566
Carbonaceous material ; Distillation of ——. (P) Hills and Thom 245
material ; Manufacture of briquettes of —— with aid of waste sulphite lye. Richter 1043

Carbonic esters of polyhydric alcohols, etc. ; Preparation of ——. (P) Hochstetter 221
Carbonisable material ; Production of acid-proof ——. (P) Western Precipitation Co. 308
Carbonisation results with coal stored in the open and in bunkers. Bunte 1144
Thermal phenomena in ——. Hollings and Cobb 685
Carbonising chamber for gas works ; The Koppers combination ——. Cooper 410
coal or other carbonaceous materials ; Retorts for ——. (P) Tozer 912
Method of ——. (P) Berglof 243
peat, lignite, wood, sawdust, and other solid fuels ; Regenerative oven for ——. (P) Guardabassi and Goulliard 473
wood ; Plant for ——. (P) Dittmer 825
Carbonyl group in aldehydes and ketones ; Reduction of the —— to the methylene group. Clemmensen 217
Carboxylase. Harden 658
Neuberg and Rosenthal 496
Carboxylic esters : Preparation of aromatic ——. (P) Badische Anilin und Soda Fabrik 221
Carboys ; Manufacture of glass ——. (P) Schiller 25
Carburetting alcohols for industrial uses, during manufacture. (P) Boulais and Lefèvre 473
Use of esters of fatty acids for ——. (P) Soc. d'Etude du Carburol 191
water-gas ; Thermal reactions in ——. Whitaker and Rittman 682
Cardamoms and cardamom oil. Beringer 1112
Cardboard ; Board of Trade bulletin on —— 1085r
Carica Papaya juice ; Standardisation of dried ——. Shelley 500
Carminic acid :
Dimroth 956
Liebermann and Liebermann 544
Carnauba wax. Lüdecke 362
Carnotite ; Treatment of ——. (P) McCoy 794
Carnotites ; Radium : uranium ratio in ——. Lind and Whittemore 1087
Carone ; Action of ammonium hydrosulphide on ——. Agostinelli 983
Carotting hair and fur ; Process for ——. (P) Paris 640
Carthamus tinctorius, L., from Nyasaland ; Seeds and oil of —— 147
Cartridges ; Explosive —— containing liquid oxygen. (P) L'Air Liquide Soc. Anon. 376
Carvacrol ethers ; Preparation of ——. Sabatier and Mailhe 1114
Carvomenthene ; Conversion of limonene into ——. Vavon 374
Carvoxime ; Reduction of —— by means of palladium and hydrogen. Wallach 333
Cascara ; Determination of free and combined hydroxymethylanthraquinones in ——. Daels 1071
Cascara sagrada. Its history, growth, collection, and bibliography. Johnson and Hindman 1170
Case-hardening compound. (P) Blaich 792
iron and steel articles ; Process for ——. (P) Burian, and Gebr. Schubert 426r
mixture. (P) Sallows and Blaich 30
practice ; Some recent improvements in ——. Heathcote 552
process. (P) Machlet 968
Casein for coated papers. Sutermeister 588
in milk ; Determination of —— by means of ferric alum. Arny and Schaefer 979
in milk ; Rapid determination of ——. Walker 273
Phosphorus content of ——. Bosworth and Van Slyke 1023
preparations ; Production of ——. (P) Dunham, and Casein Co. of America 42
Casein calcium and process for producing it. (P) Hoffmann-La Roche und Co. 374

PAGE
Casein—*cont.*
  compounds; Composition and properties of —— and their relation to cheese. Van Slyke and Bosworth 609
  -glue; Preparation of ——. (P) Bernstein and Bernstein 432
Caseinogen; Action of diazomethane on ——. Geake and Nierenstein 1023
Cassava roots and refuse. Kling 1109
  starch; Production of dextrin from ——. (P) Riboud and Ahnert 327
Cassiopeium, a constituent element of ytterbium. Auer von Welsbach 21
Casting: Die- ——, or casting under pressure. Horner .. 203
  furnace. (P) Hall 320
  ingots of metals and alloys; Method and apparatus for ——. (P) Durville 699
  ingots and other castings; Process for ——. (P) Melaun 792
  from volatile metals or alloys; Process for ——. (P) Hall 795
Castings; Study of the annealing process for malleable ——. Storey and Leasman 695
  Study of the strength of non-ferrous ——. Comparison of different test specimens. Webbert 1212
  Thermal treatment of steel ——. (P) Soc. Anon. Italiana Gio. Ansaldo & Co. 144*r*
Castor seed trade of Marseilles 875
  seeds; Activity of the lipase of —— at low temperatures. Blanchet 428
  seeds; Detection of ——. Lander and Geake 763
Catalase of dried yeast. Harden and Zilva 761
  -reactions of formaldehyde and acetaldehyde. Woker 444
Catalysis of acids; Use of manganous oxide for the ——. Sabatier and Mailhe 437, 501
  in the gas industry. Lessing 1193
  Lecture on ——. Sabatier 733
Catalysts. (P) Wimmer and Higgins 426*r*
  Acid ——. Mailhe 437
  Influence of impurities on the activity of ——. Paal and Windisch 90
  Manufacture of ——:
    (P) Ellis 408, 556
    (P) Schwarcman, and Spencer, Kellogg and Sons 1047
  Preparation of ——. (P) Dewar and Liebmann 797
  Preparation of —— for hydrogenating oils, etc. (P) Ellis 208, 208
  for the preparation of ketones; Comparative value of ——. Senderens 160
  Process for regenerating —— for hydrogenating oils. (P) Naaml. Venn. Ant. Jurgens Vereen. Fabr. 557
  for use in hydrogenising oils and fats; Metallic ——. (P) Byrom 757
Catalytic agents for hydrogenating oils; Manufacture of ——. (P) Fuchs 702
  agents; Preparation of ——. (P) Badische Anilin und Soda Fabrik 24, 483, 550*r*
  chemical reactions; Apparatus for facilitating ——. (P) Lelarge 906
  material; Manufacture of ——. (P) Boberg, and Techno-Chemical Laboratories, Ltd. 550*r*
  material; Manufacture of —— for hydrogenating oils. (P) Ellis 32
  reactions; Process for carrying out ——:
    (P) Andersen 470*r*
    (P) Hagemann and Baskerville 207
  reactions; Production of light voluminous metallic oxides for ——. (P) Bedford and Erdmann 24*r*
Catechol; Compounds of —— with alkali salts of carboxylic acids. Weinland and Denzel 1027
Cathode for rapid electrolytic analysis; Cheap form of rotating ——. Lewis 445
Cathodes; Disintegration of aluminium ——. Campbell .. 970
  for electric furnaces. (P) Sodium Process Co. 602*r*
Cathodic reduction; Electrode for preventing ——. (P) Pietzsch and Adolph 146*r*
  spattering of metals. Kaye 868
Cattle fodder; Detection of certain toxic substances in ——. Kobert 937
  food; Beetroot leaves as ——. Hitier 273
  foods; Manufacture of ——. (P) Eastick and de Whalley 98, 803
Caucasus; Mineral oil industry of the —— 635
Caustic liquors; Evaporating and concentrating apparatus for ——. (P) Moore 781
Causticising operations; Recovery of the spent lime from ——. Payne 1153
  plant; Composition and agricultural value of waste calcium carbonate from ——. Hendrick 122
Ceara rubber. *See under* Rubber.
Cedar wood; Oil of Port Orford ——. Schorger 886
Celite: Synthetic ——. Campbell 964
Cellose; Conversion of —— into fermentable sugar. (P) Ekström 349
  Method of producing ——. (P) Ekström 349
Celluloid; Absorption of gases by ——. Lefebure 307
  Apparatus for producing films or bands from volatile solutions of ——. (P) Borzykowski 349*r*

PAGE
Celluloid—*cont.*
  articles; Process for cleaning and renewing ——. (P) Püschel 20, 196*r*
  chemistry; Problems of ——, and the necessity of colloid-chemical views in this industry. Schwarz 856
  Hyatt's invention of —— 225, 227, 677
  substitute; Manufacture of a ——. (P) Von Szolayski 417, 828*r*
  substitute from soya beans. (P) Contant and Perrot 20
  substitutes; Manufacture of ——. (P) Labbé 1045*r*
  substitutes; Manufacture of —— from ethers of starch, dextrin, etc. (P) Lilienfeld 958
  Utilisation of acetylnitrocelluloses for ——. Nishida 476
  Who invented ——? Schüpphaus 678
Cellulose; Action of concentrated sulphuric acid on ——. Tschumanow 744
  Action of cuprammonium hydroxide on ——. Connerade 744
  Action of strong nitric acid on cotton ——. Knecht and Lipschitz 116
  from bamboo or the like; Production of ——. (P) Jardine and Nelson 1006
  Bleaching of ——. (P) Dobson 196
  Colouring, preserving, fireproofing, and increasing the strength of materials composed chiefly of ——. (P) Trutzer 750
  Decomposition of —— by heat. Bantlin 129
  and its derivatives; Nitration of —— by means of nitric acid vapours. (P) Deutsche Celluloidfabrik 335
  Electrical treatment of —— or substances containing it. (P) Nodon 196*r*
  Extraction of resins from wood for making sulphite or other ——. (P) Rosenblum and others 19
  extracts and their detection in tanning extracts and in leather. Moeller 840
  factories; Apparatus for purifying waste water from ——:
    (P) Mann und Co. 478
    (P) Mann and Heess 859*r*
  films; Manufacture of products composed of ——. (P) Brandenberger 958
  finishing preparation. (P) Soc. Industrielle des Téléphones 73
  in flour; Determination of —— to ascertain the degree of grading. Lindet 609
  Hydrolysis of methylated ——. Denham and Woodhouse 1084
  and lignocellulose. Cross 1201
  for making cellulose solutions; Preparation and requirements of ——. Piest 856
  Manufacture of lustrous threads with a basis of ——. (P) Joliot 958
  Manufacture of purified viscose solution from wood ——. (P) Bernstein 196
  Manufacture of threads of hydrated ——. (P) Pellerin 589
  material; Conversion of —— into glucose and other carbohydrates. (P) Classen 761*r*
  Mercerisation as judged by the action of caustic soda on regenerated ——. Beadle and Stevens 785
  Method of bleaching ——. (P) Dobson 859*r*
  mills; Soda recovery plant in soda- ——. Schröder 744
  Plant for the manufacture of —— by the indirect boiling process. (P) Morterud 746
  Preparation of pure ——. (P) Daniel and Benoist .. 588
  Preparation of solutions of —— or substances containing it, in concentrated hydrochloric acid. (P) Willstätter 746, 859
  Preparation of solvents for ——. (P) Wassermann .. 785
  Process for bleaching ligno- and pecto- ——. (P) De Vains and Peterson 746*r*
  Production of sugars from ——:
    (P) Gallagher and Mork 441, 801*r*
    (P) Standard Alcohol Co. 37*r*
  Production of sulphite ——. (P) Oman 348, 828*r*
  products; Manufacture and strengthening of ——. (P) Chesnais 417
  products; Process for rendering impermeable articles made of ——. (P) Lagrange 417
  pulp; Apparatus for concentrating, washing, or bleaching ——. (P) Gunn 308
  from raw vegetable materials containing cellulose fibres; Manufacture of ——. (P) Brech and Tyborowski 746*r*
  from resinous woods; Manufacture of ——. (P) Soc. Anon. Le Camphre 248
  sheets, films, or threads; Process for metallising ——. (P) Crumière et Cie. 480
  soda-, process; Dyes and other products from the waste liquor of the ——. Cram 1151
  solution; Production of shaped articles from copper-ammonium ——. (P) Bronnert, and Verein. Glanzstoff-Fabriken A.-G. 859*r*
  solutions; Apparatus for pumping or regulating the flow of ——. (P) Criggal 477
  solutions; Manufacture of artificial threads, filaments, etc., from copper ——. (P) Verein. Glanzstoff-Fabriken, and Bronnert 72*r*
  solutions; Preparation of —— and manufacture of products therefrom. (P) Berl 132*r*
  solutions; Production of textile articles from ——. (P) Borzykowski 417
  spent lyes; Recovery of by-products from soda ——. Langlet 307

- Chemistry; Prediction and invention in ——. Potts 392
  - Some economic aspects of industrial ——. Hesse 897
- Cherry-laurel leaves; Hydrocyanic acid content of ——. Wester 332
- Chestnut wood tannin; Distinguishing —— from oak wood and valonia tannins. Bennett 1186
- Chicory; Detection of —— in decoctions of chicory and coffee. La Wall and Forman 38
- Chile; Nitrate industry of —— 76
  - Sodium nitrate, borax, and phosphate in —— 749
- China clay. *See under* Kaolin.
  - ware; Production of translucent ornaments or designs in ——. (P) Greifelt 921
- Chinese beeswax. Fischer 90
  - bitter orange (*Citrus sinensis*, Person); Characters of oil of ——. Fenaroli 710
  - block gambier. Sommerhoff and Apostolo 839
  - green (lokao dyestuff). Rüdiger 742
  - tallow. Diedrichs 1098
  - wood oil (tung oil). *See under* Oils, fatty.
- Chloral; Manufacture of —— 941
  - Polymerisation of ——. Bœseken and Schimmel 1223
- Chlorate solutions; Process for activating ——. (P) Hofmann 200, 353r
- Chlorates; Analysis of —— by a new reduction method. Russo and Sensi 279
  - Effect of magnesium chloride on the oxidising action of ——. Hofmann and others 742
  - Electrolytic process and apparatus for making ——. (P) Kolsky 549
  - Process for removing bromate from ——. (P) Chem. Fabr. Griesheim-Elektron 790
  - Reduction of —— to chlorides by hydrazine salts with the aid of a catalytic substance. Hodgkinson 815
- Chloride solutions; Electrolysis of —— with a mercury cathode. Le Sueur 74
- Chlorides in albuminous liquids; Determination of ——. Gazzetti 1174
  - in drinking water; Importance of the amount of —— for control and evaluation. Malméjac 371
  - of the hydroxy-acids; Preparation of acid ——. (P) Karczag and Kopetschni 943r
  - Means for the electrolysis of alkali or alkaline-earth ——. (P) Clemm 312, 354r
  - Preparation of anhydrous metallic —— by treating the sulphates with chloroform. Conduché 590
  - of rare earths; Preparation of anhydrous —— free from oxychlorides. (P) Deutsche Gasglühlicht A.-G. 312
  - Reduction of liquid anhydrous —— in the reversed chlorine-hydrogen flame. Meyer and Kerstein 548
  - Treatment of alkali ——. (P) Kendall 22, 485r
- Chloridising copper ores; Process of ——. (P) Ledoux 88, 871r
  - -leaching of low-grade ores at Park City, Utah. Holt 1011
- Chlorination by means of *aqua regia*. Chlorination of benzene, thiophen, toluene, and mesitylene. Datta and Fernandes 1198
  - and oxidation by means of *aqua regia*; Simultaneous ——. Datta 1198
  - Process and apparatus for ——. (P) Du Pont de Nemours Powder Co. 440r
- Chlorine; Chief cause of the loss of —— by incinerating substances containing it. O'Sullivan 1076
  - Effect of ferric salts and nitrites on the o-tolidine and starch-iodide tests for free ——. Ellms and Hauser 804
  - Electrolytic —— at Mount Morgan, Queensland. Du Faur 198
  - and nitric oxide; Rate of combination of ——. Coates and Finney 1206
  - water; Decomposition of —— in the light. Milbauer 310

PAGE
Chlorine derivatives of the amyl series; Production of ——. (P) Badische Anilin und Soda Fabrik 807*r*
Chloroanil; Preparation of —— from *p*-phenylenediamine or quinol. Datta 1198
1-Chloro-anthraquinone; Preparation of ——. (P) Meister, Lucius, und Brüning 70
  Preparation of nitro and chloro derivatives of ——. (P) Meister, Lucius, und Brüning 544
2-Chloro-anthraquinone-3-carboxylic acid. Ullmann and Dasgupta 305
Chloro-anthraquinones; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 18, 587*r*
Chloro compounds; Preparation of cyclic ——. (P) Fabr. de Produits de Chimie Organique de Laire 503, 668*r*
Chloro-ethanes; Determination of the ——. Gowing-Scopes 987
Chloroform; Action of —— on metallic sulphates. Conduché 590
  Preparation of ——. (P) Griswold and others 844
  Presence of acetone in commercial ——. Dorronsoro and Fernandez 1223
Chlorohydrocarbons; Conversion of aromatic —— into polyvalent phenols. (P) Torley and Matter 347*r*
  Preparation of alcohols from ——. (P) Du Pont de Nemours Powder Co. 374, 375*r*
  Properties of some —— and their use in analysis. Gowing-Scopes 160
4-Chloro-1-hydroxyanthraquinone and its derivatives; Manufacture of ——. (P) Ullmann 913
Chloromethanes; Absorption of ultra-violet light by the ——. Massol and Faucon 1115
1.4-Chloromethylanthraquinone; Action of nitric acid on ——. Fischer and Itebsamen 306
Chloro-2-methylanthraquinones; Manufacture of ——. (P) Act.-Ges. f. Anilinfabr. 18
Chloromethyl-ω-bromopropyl carbinol; Preparation of —— and its oxidation product. (P) Davis, and Eli Lilly and Co. 1171, 1171
6-Chloro-1-methyl-3-hydroxybenzene-4-carboxylic acid; Preparation of ——. (P) Riedel 807
Chlorophyll in brown algæ. Willstätter and Page 1005
  extracts as fuel; Use of ——. (P) Bouchaud-Praceiq 852
Chocolate; Apparatus for use in the manufacture of ——. (P) Edwards and Rance 148
  Preparation of ——. (P) Neumann 371, 763*r*, 1219*r*
  preparations for diabetics. Street and Mendel 1218
  Treatment of cacao beans in the manufacture of ——. (P) Vignes 660
Cholera vibrio; Bactericidal and antitoxic action of lanthanum and thorium salts on the ——. Frouin and Itoudsky 942
Cholesterol; Colorimetric determination of ——. Grigaut 276
  in fats; Determination of ——. Klostermann and Opitz 651
  in petroleum oils; Alleged occurrence of ——. Steinkopf and Winternitz 584
Cholic acid; Preparation of the cupric salt of ——. (P) Knoll und Co. 668
  Strontium salt of ——. (P) Werner 43*r*
Cholin; Some new physiologically active derivatives of ——. Ewins 1027
  series; Preparation of compounds of the ——. Houben and Führer 1113
Chromate solutions; Manufacture of alkali ——. (P) Payne and Gignoux 136
Chromates; Some double ——. Barre 253
Chrome steels; Magnetic properties of a graded series of —— at ordinary and low temperatures. Moir .. 553
  steels; Permanent magnetism of certain ——. Moir .. 1091
  ulceration. Report of Inspector of Factories and Workshops 895
  -vanadium steel wheels; Rolled —— in the United States 28
Chromic acid; Esters of ——. Wienhaus 276
  Neutralisation of ——. Margaillan 21
  salts of heavy metals and alkaline-earth metals; Manufacture of ——. (P) Mühlbauer 255
Chromic oxide jellies. Bunce and Finch 75
  Manufacture of compounds of ——. (P) Chem. Fabr. vorm. Weiler-ter Meer 550
Chromic salts; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 864
Chroming in dyeing Aniline Black; Process and apparatus for continuous ——. (P) Bemberg A.-G. 547
Chromites; Synthesis of ——. Pukall 863
Chromium; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  -bronze; Attempts to produce —— electrolytically. Kremann and others 752
  Determination of —— by alkaline oxidation. Bourion and Sénéchal 104
  Determination of —— as chromic oxide. Rothaug .. 44
  Electrometallurgical manufacture of pure —— or its alloys from slags. (P) Keller 204, 871*r*
  Increasing the yield of —— in the aluminothermic production of carbon-free ferrochromium from chrome-iron ores. (P) Goldschmidt A.-G. 490*r*

PAGE
Chromium—*cont.*
  -nickel steels; Transformation points and structure of ——. Guillet 260
  ores; Electric smelting of ——. Keeney 358
  Volumetric determination of —— by means of a modified reductor. Van Brunt 808
Chromium arsenides and phosphides; Some ——. Dieckmann and Hanf 420
  colouring matter; Manufacture of ——. (P) Mühlbauer 255
  compounds of hydroxyanthraquinonesulphonic acids; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 348*r*
  hydroxide; Absorption of carbon dioxide from the air by ——. Iovitchitch 420
  nitrides. Moldenhauer and Groebe 748
  oxide as colouring agent in a matt glaze; Effect of variation of RO elements on ——. Minton 1050
  oxide; Equilibria of the reduction of —— by carbon. Slade and Higson 649
  perchlorate. Weinland and Ensgraber 74
Chromoform. Schmitz 941
Chromous metaphosphate. Colani 351
  oxide. Dieckmann and Hanf 420
Chrysophanic acid; Some reactions of —— with reference to its detection in complex medicinal compounds. Bailey 501
Chuquicamata, Chile; Leaching and electrolytic treatment of copper ores at ——. Smith 1011
Churns. (P) Williams 906
Cider; Determination of tannin in ——. Spiers 213
  Disease of —— known as green-sickness. Warcollier 496
  Treating and bottling ——. (P) Robbins 563
Cinchona bark; Exportation of —— from the Netherlands 939
  trees grown in Madagascar; Value of the ——. Perrot and Huber 804
Cinchona Ledgeriana, Moens; Occurrence of quinine in the seeds of ——. Van Leersum 373
Cinchotoxine; Combination of bromine with ——. Rohde and Meissner 611
Cinematograph films; The carbon process of photography for producing ——. (P) Thornton 278
  films; Manufacture of ——. (P) Jerne 1116
  films; Plastic material for use in making ——. (P) Danzer, and Comp. Générale de Phonographes, Cinématographes, et Appareils de Précision 375*r*
  films; Production of coloured reliefs for use in making ——. (P) Kent 222*r*
Cinematography; Colour ——. (P) Donisthorpe 503
Cineol; Addition compounds of ——. Bellucci and Grassi 159
  in eucalyptus oils; Determination of ——. Harding 1171
  Iodo-derivatives of ——. Determination of cineol. Fromm and Fluck 710
  Preparation of a peroxide from ——. (P) Ramage and others 844
Cinnamic acid and its salts as preservatives. Serger 882
Cinnamic aldehyde; Stability of ——. Phillips 843
Cinnamic aldehyde ozonide. (P) Knox, and Knox Terpezone Co. of America 374
Cinnamon; Composition of ——. Dafert and Miklauz .. 1112
Citral; Hydrocarbons obtained from ——. Kijner 1222
Citric acid; Colour reaction of ——. Häussler 891
  Comparison of *N*/10 —— with neutral ammonium citrate. Rudnick and others 704
  in wines; Presence of ——. Blarez, Denigès, and Gayon 212
Citronella; Effect of climatic conditions on ——. Umney 1222
  oil. *See under* Oils, essential.
Citronellal; Hydrocarbons obtained from ——. Kijner .. 1222
Clarifying apparatus for intermittent or continuous working. (P) Pappé 822
  liquids; Apparatus for ——:
    (P) Lowden, and Colorado Iron Works Co. 780
    (P) Reid 1170
  liquids; Process for ——. (P) Marcus 188, 583*r*
Classifying comminuted materials; Process and apparatus for ——. (P) Sutton and Steele 1143
Clay; Acid —— in Japan 757
  Air-drying apparatus for ——. (P) Borlase and Borlase 137
  Compression, tensile, and transverse strength of —— in the dried state. Bleininger and Howat 1048
  Effect of some electrolytes on ——. Back 1048
  Effect of overburning on the structure of ——. Bleininger and Montgomery 78
  Effect of varying compression loads applied to —— in the plastic condition. Parmelee 1048
  Electrical conductivity of ——. Determination of soluble salts. Bleininger and Kinnison 78
  filters and certain salt solutions; The action between ——. Hicks 1046
  Function of time in the vitrification of ——. Brown and Murray 78
  Influence of soluble salts in —— upon behaviour of slip and glaze. Coats 1050
  The plasticity of ——. Davis 1048

Clay—*cont.*
  products; Apparatus for drying ——. (P) Rodgers.. 1088
  products; Tunnel dryers for drying ——. (P) Stevenson 1088
  Recovery of oils and combustible materials from ——, and their use in the manufacture of bricks, etc. (P) Crowden 1089
  refractories; Relative thermal conductivities of silica and ——. Brown 1052
  Refractory materials from —— and their testing. Rigg 619
  Restoration of plasticity to pottery scrap ——. Minneman 1049
  soils; Determination of humus in heavy ——. Beam 153
  Study of the Atterberg method of measuring plasticity of ——. Kinnison 1048
  suspensions; Electrical conductivity of ——. Bleininger and Kinnison 78
  Thermal analysis of ——. Wohlin 78
  Treatment of ——. (P) Mowry and Secord 951
  Treatment and moistening of —— for the manufacture of ceramic products moulded under high pressure. (P) Hidoux and Bernheim 25
  ware; Continuous kilns for burning ——. (P) Legg.. 259
Clays; Application of the osmose purification process to British ——. Ormandy 257
  Causes of plasticity and allied properties of ——. Rohland 313
  Causes of plasticity, binding power, shrinkage, and absorption of ——. Rohland 258
  Classification of ——. Müntz and Gaudechon 24
  Effect of graphite on refractory ——. Schreiber 963
  Rational analysis of ——. Burian and Juránek 963
Cleaning tubular and other vessels used for treating peat. (P) Rigby and others 850*r*
Cleansing preparation. (P) Slack 148
Clematis vitalba; Constituents of ——. Tutin and Clewer 885
Cloth for the Army; The dyeing of —— 1005
  Machine for treating —— with liquids. (P) Rau and Rau 418
  Preparation of —— for testing its resistance to wearing. (P) Kertesz 1203
  Process for applying metallic coatings on ——. (P) Worsley and Greenwood 960
Clothing; Protection of —— against moths, beetles, and insects. (P) Act.-Ges. f. Anilinfabr. 939, 939*r*
Clouding agents for enamels; Covering power of ——. Vondracek 647
  agents for producing cloudened effects in white enamels. (P) Kreidl 750*r*
Clove oil and clove leaf oils from Mauritius.......... 805, 805
Cloves; Cultivation of —— in Zanzibar. McClellan 1073
  from Zanzibar 1073
Coal; Absorption of gases by ——. Leprince-Ringuet .. 303
  Absorption of oxygen by ——. Winmill and Graham.. 1000
  Apparatus for coking ——. (P) Doherty 16
  Apparatus for distilling ——. (P) Hughes 1083
  Apparatus for preparing and sorting comminuted or powdered ——. (P) Coyle 1196
  Apparatus for testing ——. (P) Habets and France .. 344
  Apparatus for treating ——. (P) Scott 1150
  Apparatus for washing ——:
    (P) Burks and Hayes 1043
    (P) Habets and France 471
  bed; Weathering of the Pittsburgh —— at the experimental mine near Bruceton, Pa. Porter and Fieldner 850
  briquettes; Manufacture of ——:
    (P) Naamlooze Vennootschap Briquet Co. 825*r*
    (P) Pure Coal Briquettes, Ltd. 852
  Briquetting —— by means of a mixture of pitch and tar oils. (P) Moreau 635
  Briquetting —— with waste sulphite-cellulose lye. (P) Grätz 471
  burner; The Dunn pulverised ——. Roush 65
  Carbonisation of ——. (P) Lewes 585
  carbonising retorts; Heating of vertical ——. (P) Duckham 684
  and the chemistry of its carbonisation. Harger 389
  Composition of ——. Jones and Wheeler 192, 1082
  Compound for treating ——. (P) Harris 542
  Continuous carbonisation of —— in vertical retorts. (P) Toogood, and Dempster and Sons, Ltd. 823
  Distillation of ——. (P) Stephenson 636
  distillation; Formation of ammonia and hydrogen cyanide in ——. Simmersbach 781
  Distillation of —— in large charges, and apparatus therefor. (P) Brenillé 636
  distillation products; Direct recovery of ammonia from ——. (P) Still 637
  distillation retorts. (P) Anderson and others 542
  distillation retorts; Continuous vertical ——. (P) Comp. Générale de Construction de Fours 852
  Distillation of soft ——. and utilising the products for creosoting timber, etc. (P) De Nagy 686
  distillation; Treatment of hot gases produced by ——. (P) Leech and Edwards 823
  Distillation of —— in a vacuum. Burgess and Wheeler 191
  distillation; Vertical retorts for continuous ——. (P) Comp. Gén. de Construction de Fours 953

Coal—*cont.*
  Dry distillation of ——. (P) Ludwig 192
  dust; Conversion of —— into a commercial fuel. (P) Evans 243, 412*r*
  dust firing for reverberatory copper smelting furnaces. Mathewson 1093
  Method and means for separating ——. (P) Blackhurst and Blackhurst 469
  mines; Explosives in ——. Home Office Order 986
  mines; Fireclay in ——. Mellor 1009
  mines; List of permitted explosives in —— 334
  mining plant; Utilisation of waste from —— by mixing with coal sludge. (P) Hilgenstock 782
  mining waste; Utilisation of —— by mixing with coal sludge. (P) Hilgenstock 636
  Oxidation of sulphur compounds and nitrogen of —— in the bomb calorimeter, and the correction to be applied in determining the heating value of coal. Regester 1041
  Preparation of a solution for economising ——. (P) Lewison 635
  Process for agglomerating ——. (P) Steven 635, 740*r*
  Process for treating ——. (P) Scott 1150
  Production of acetic acid and alcohol from ——. (P) Behrens 807
  Production, exports, and consumption of —— in the United Kingdom 84, 85
  Production of oils from ——. (P) Rollason 345
  Recovery of nitrogen as ammonia from ——. Cobb .. 541
  Resins in —— of high rank. White 682
  Retorts for distilling or carbonising ——. (P) Tozer.. 912
  Screening or grading and conveying ——. (P) Benson, and Head, Wrightson and Co., Ltd. 67
  slimes; Draining and concentrating ——. (P) Hunter, and Simon-Carves Bye-Product Coke Oven Construction and Working Co. 410
  slimes; Drying ——. (P) Brune and others 781
  solvents. Vignon 633
  stored in the open and in bunkers; Carbonisation results with ——. Bunte 1144
  Temperature of formation of tar from American —— .. 1042
  Thermal phenomena in the carbonisation of various kinds of ——. Hollings and Cobb 685
  Treatment of —— in vertical retorts. (P) Waddell 346*r*, 825*r*
  Use of pulverised —— in metallurgical furnaces. Lord 83
  washing apparatus with multiple ascending currents. (P) Habets and France 303
  washing plant. (P) Thomson 67
  washing; Process for ——. Ford 241
Coated sheets; Process of drying ——. (P) May and Grosvenor 858
Coating composition; Protective ——. (P) Baekeland, and General Bakelite Co. 325
  compositions: Manufacture of ——:
    (P) Cuneo 973, 1215*r*
    (P) Eberhard 33*r*
  fabrics, cords, cables, etc.; Apparatus for ——. (P) Destribats 133
  flexible objects of organic origin with metal. (P) Rafn and Schmidmer 747*r*
  materials with cellulose esters. (P) Act.-Ges. f. Anilinfabr. 20, 350*r*
  materials; Manufacture of ——. (P) Roth 605*r*
  objects with subdivided material; Process for ——. (P) Bradley, and Bradley and Vrooman Co. 408
  surfaces; Manufacture of compositions for ——. (P) Eberhard 267
  surfaces; Process and apparatus for ——. (P) Morcom 968
Coatings from cellulose ethers; Manufacture of ——. (P) Lilienfeld 417*r*
Cobalt; Alloys containing ——. (P) Haynes 264*r*
  and its alloys; Experiments on ——. Kalmus 261
  and aluminium; Alloys of ——. Neuberger 203
  Bromination of —— in presence of ethyl ether. Ducelliez and Raynaud 787
  Colorimetric determination of ——. Hüttner 614
  Extraction of —— from copper containing cobalt. (P) De Burlet 1014
  filaments for electric lamps; Manufacture of ——:
    (P) Kanazawa 192*r*
    (P) Tanimura 69
  in high-speed steels; Determination of ——. Dufty.. 1011
  Preparation of metallic —— by reduction of the oxide. Kalmus 261
  Reaction for ——. Malatesta and di Nola 335
  Some recent applications of metallic ——. Browne.. 967
  in steel; Determination of ——. Slawik 487
  in varnishes; Detection of ——. Malatesta and di Nola 798
Cobalt-magnesium red. Hedvall 429
  oxides. Kalmus 253
  oxides; Higher ——. Metzl 591
  sulphide. Thiel and Gessner 310
  -uranium colours for pottery glazes; Some ——. Radcliffe 1050
Cobalt, Ontario; Assay of silver ores of ——. Smoot 1211
Coca alkaloids. De Jong 939
Cocaine; Detection of ——. Denigès 843
  Exportation of —— from the Netherlands 939
  New reaction of ——. Pisani 982

Collargol ; Determination of silver in ——. Danckwortt .. 1074
Collodion in leather finishing ; Uses of ——. Higgins 704
  Manufacture of nitrocellulose for ——. Chandelon .. 222
Collodions ; Viscosity of ——. Chandelon 222
Colloidal carbon obtained by a chemical method. Sabbatani 692
  cuprous oxide. Paal and Dexheimer 787
  ferric hydroxide ; Preparation of ——. Cohen 135
  gold solutions ; Immediate coagulation of —— by gold, silver, or aluminium foil. Von Weimarn 1229
  gold solutions ; Preparation of ——. Halle and Pribram 597
  gold solutions ; Reactions in the preparation of —— by the formaldehyde method. Influence of carbonic acid on the formation of these solutions. Von Naumoff 868
  matter in sewage disposal ; Significance of ——. O'Shaughnessy 609
  nickelous hydroxide. Paal and Brünjes 787
  selenium for use in medicine. Gutbier 888
  solutions of base metals ; Preparation of aqueous —— by disintegration. Zavrieff 597
  solutions ; Measurement of the Tyndall effect in ——. Mecklenburg 569
  solutions ; Preparation of —— by mechanical subdivision. Wegelin 254
  solutions ; Processes which occur on shaking —— with liquids or solids which are practically insoluble in the dispersion-medium. Von Weimarn and Alexejew 670
  solutions of radio-active elements. Paneth 22
  solutions of rare metals ; Preparation of ——. (P) Grauert 1075
  solutions of sulphur and selenium in glycerol and erythritol ; Preparation of ——. Von Weimarn.. 1206
  substances ; Catalytic action of some —— at great dilutions. Sommerhoff 95
  substances ; Dehydration of ——. (P) Richter and Richter 342
  substances ; Preparation of soluble ——. (P) Sarason 568
Colloids in beer ; Determination of ——. Marc 562
  in effluents ; Determination of ——. Marc and Sack 564
  Influence of —— on microbiological processes. Söhngen 329
  Method of rendering —— insoluble. (P) Mercier 209
  Production of metal ——. (P) Crookes and Stroud 86, 1172r
  The results of the study of ——. Svedberg 1190
Colophony ; Melting points of acids derived from ——. Paul 557
  Water soluble rosin acids of American ——. Paul .. 429
Colorado ; Empressite, a new silver-tellurium mineral from ——. Bradley 922
  soils ; Excessive quantities of nitrates in certain ——. Headden 799
Colour measurement and nomenclature ; Industrial applicability of the various systems of ——. Krais 197
  of metals and alloys ; Method of obtaining a measure of the ——. Thompson and Sinkinson 597
  photography :
    (P) Brewster 986
    (P) Fischer 334r
    (P) Ungerer 222
  photography and colour printing. (P) Rheinberg and Rheinberg 1116
  photography and kinematography :
    (P) Donisthorpe 503
    (P) Fox and others 1227
  photography ; Manufacture of polychrome screen plates for ——. (P) Lumière and Lumière 845
  photography ; Processes of —— :
    (P) Caille 440, 440
    (P) The Hess-Ives Co. 441, 485r

- Colour—*cont.*
  - photography; Production of bleaching-out layers for ——. (P) Szczepanik and Habrich 845r
  - printing. (P) Turkin 747
  - processes; Photographic ——. (P) Fox and others.. 1227
  - screens for colour photography; Process of making ——:
    - (P) Dawson and others 278r
    - (P) Späth, and Eastman Kodak Co. 103r
  - of tanning extracts; Measurement of the ——. Procter 605
  - valuation of tanning materials. Kerr 1163
- Colouring agent for viscous sugar masses, especially for use in making caramels. (P) Ungemach A.-G. Els. Conserven-Fabrik u. Import-Ges. 879
  - agents and their production. (P) Vidal 416r
  - fabrics; Method and apparatus for ——. (P) Rousseau 134r
  - matter of the cornflower; The ——. Willstätter and Everest 18
  - matter for food and other products; Preparation of a harmless ——. (P) Jacquemin 19
  - matter for paper making and like manufactures; Production of ——. (P) Hahn 1006
  - matters; Action of bleaching agents on various natural ——. Taylor 308
  - matters of flax and hemp; Natural ——. Bianchi and Malatesta 588
  - matters of *Fusarium*; The ——. Bezssonoff 913
  - matters; Manufacture of fast, light-proof ——. (P) Turkin 742, 828r
  - matters of *Rhamnus catharticus*. Oesch and Perkin.. 1199
  - matters of the sugar cane; Natural —— and their influence in the manufacture of white sugar. Muller 494
- Colours containing chromium; Effect of zinc on underglaze ——. Pence 80
  - Diazotisation and development of aged —— on the fibre. Freiberger 859
  - Manufacture of compositions for binding or adding to ——. (P) Eberhard 33r, 267
  - Method and means for recording, matching, or devising new shades of ——. (P) Parsons and Coker 1045
  - Nickel in glaze ——. Wicks and Mellor 258
  - Nickel underglaze ——. Perry 258
  - for pottery glazes; Some cobalt-uranium ——. Radcliffe 1050
  - Preventing injurious effect of zinc white on the fastness to light of water- ——. Täuber 266
  - Production of underglaze —— by use of soluble metallic salts. Howe 1050
  - Secondary ——. Havas 414
  - Supply of ——. Board of Trade Announcement 1084
- Combustible elastic fluid mixtures; Means for regulating ——. (P) Ionides 824
  - gaseous mixture; Method and means for mixing the constituents of a ——. (P) Ionides 1149
  - gases; Detectors of ——. (P) Philip and Steele 378
  - gases; Device for detecting ——. (P) Accumulatoren Fabrik 846
  - liquid from heavy hydrocarbons; Manufacture of ——. (P) Hall 853
  - matter from refuse; Extracting or sorting ——. (P) Hidoux and Bernheim 39
  - mixtures; Combustion of ——. (P) McCourt, and Bonecourt Surface Combustion, Ltd. 686, 953
  - mixtures for internal-combustion engines. (P) Heyl.. 685
  - mixtures; Surface combustion of ——. (P) Kirke, and Bonecourt Surface Combustion, Ltd. 1001
- Combustion analysis by means of tellurium dioxide. Glauser 223
  - of combustible mixtures. (P) McCourt, and Bonecourt Surface Combustion, Ltd. 686, 953
  - of combustible mixtures; Surface ——. (P) Kirke, and Bonecourt Surface Combustion, Ltd. 1001
  - Flameless incandescent surface ——. Gray 682
  - Flameless surface ——. Dobbelstein 409
  - in gas-fired furnaces; Apparatus for increasing the temperature of ——. (P) Doherty 1193
  - of gas; Partial and intermittent ——. Somermeier .. 584
  - of gaseous mixtures. (P) Bonecourt Surface Combustion, Ltd. 304
  - of gases; Apparatus for the catalytic ——. (P) Schmidt and Krieger 635
  - Method of conducting ——. (P) Doherty 824
  - of mixtures of gases and air; Lower limits of ——. Somermeier 343
  - in motors. Terres 851
  - Process of controlling ——. (P) Rusby, and United Gas Improvement Co. 910
  - Process for regulating the temperature of ——. (P) Rusby and others 1001
  - products and steam; Generation of mixed —— for the production of power. (P) Kinnear 853
  - Regulation of ——. (P) Parker, and Parker-Russell Mining and Manufacturing Co. 909
  - residues, especially those from furnaces; Apparatus for separating solid ——. (P) Müller 852
  - Surface ——. Bone 303, 909
- Committee on Patent Medicines; Report of the Select —— 1034
- Committees of the Society; Lists of —— 1, 381, 717, 989
- Compressing wood or other elastic material in boilers; Method of ——. (P) Ziebarth 349r
- Concentrated products; Process for obtaining —— without loss. (P) Krause 408

- Concentrates; Decomposition of complex ——. (P) Hall 264
- Concentrating apparatus for caustic liquor. (P) Moore.. 781
  - apparatus for cleaning, separating, and classifying ores. (P) Harris 488
  - apparatus, especially for sugar manufacture. (P) Tiemann 367r
  - coal and other slimes, etc.; Method and apparatus for ——. (P) Hunter, and Simon-Carves Bye-Product Coke Oven Co. 410
  - milk and other liquids by filtration; Process for ——. (P) Kuhn 99r
  - ores and other substances; Machine for ——. (P) Wynne 319
  - soda lyes, residual liquors, etc.; Furnace for continuously ——. (P) Wolesky and Volesky 63
  - solutions; Apparatus for ——. (P) Krause 64. 865r
  - sulphuric acid and other corrosive liquids by steam heat; Tubular apparatus for ——. (P) Pritchard, and United Alkali Co. 1207
  - sulphuric acid and other liquids. (P) Carmichael and Guillaume 919
  - sulphuric acid; Process and apparatus for ——. (P) Stoffmehl 76
- Concrete; Aggregate for ——. (P) Haldeman, and Master Builders' Co. 1090
  - Apparatus for applying tensile or compressive tests to briquettes of ——. (P) Bamber 355
  - blocks or articles; Induration of ——. (P) Rigby .. 594
  - composition; Waterproof ——. (P) Olson 1009
  - -covered cast iron as a structural material. Von Emperger 81
  - Electrolysis in ——. Rosa and others 486
  - Manufacture of elastic and impermeable ——. (P) Houben 965, 965r
  - Manufacture of products of ——. (P) Owen 356r
  - Manufacture of waterproof ——. (P) Meade 550
  - Method of mixing ——. (P) Eichelberger 695
  - Preparation of ——. (P) Ettling and Chappell 259
  - Process for waterproofing ——. (P) Horn 356
  - structures; Process for hardening ——:
    - (P) Flesheim 422
    - (P) Flesheim, and Master Builders' Co. 1053r
  - Tar painting of ——. Abbott 964
- Condensation reactions; Production of ——. (P) Hibbert 984
  - Theory of fractional ——. Mixtures of alcohol and water. Chenard 880
- Condenser tubes; Influence of coke on the corrosion of brass ——. Philip 923
  - for zinc vapours. (P) Appel 870
- Condensers for ammonia gas refrigerating apparatus. (P) Dwyer 1081
  - for distilling apparatus and the like. (P) Ockel .. 341, 583r
  - used in gas works. (P) Beard, Scott, and R. and J. Dempster, Ltd. 472
  - Means for preventing or removing hard scale in surface ——. (P) Jones 1080
- Condensing acid vapours; Apparatus for ——. (P) Leblanc 311
  - apparatus for fractionating and cooling the constituents of distillation products of higher boiling point. (P) Fischer 736
  - hydrochloric acid; Apparatus for ——. Friedrich .. 309
  - milk and other liquids by filtration; Process for ——. (P) Kuhn 99r
  - vapours; Process and apparatus for ——. (P) Jaubert 737r
  - vapours of zinc and other volatile metals; Process and apparatus for ——. (P) Timm 144r, 206r
- Conditioning of textile fibres, goods, and fabrics. (P) Joseph 1152
- Congo; Copal from the ——. Lamont 149
- *Coniferæ*; Oils of the ——. Schorger 983, 1072. 1170
- Coniferous woods; The resin of —— and its removal from sulphite-cellulose. Schwalbe 857
- Contact process; Use of iron and manganese ores in ——. (P) Messerschmitt 201

Cooling—*cont.*
  granular susbstances; Apparatus for ——. (P) Samuelson and Backhouse 13
  metallurgical furnace gases before filtration. Anderson 925
  molten fats and the like. (P) Lemmens 148
  solutions or emulsions; Apparatus for ——. (P) Schröder 681
  towers; Filling material for ——. (P) Nitrogen Products and Carbide Co., and Nielsen 241, 584*r*

Cop dyeing machinery. (P) Riley, and Riley and Co., Ltd. 1085

Copaiba oil; Separation and properties of the sesquiterpenes (gurjunenes) in East Indian ——. Semmler and Jakubowitz 566

Copal from the Congo. Lamont 149

Copper; Absorption of gases by refined ——. Stahl 1158
  Action of sulphuric acid on ——. Cundall 203
  alloy. (P) Westley 488
  in alloy steels; Determination of ——. U.S. Bureau of Standards 139
  and its alloys; Colouring —— brown by copper sulphate solutions. Groschuff 752
  alloys containing a small amount of tin; Process for hardening ——. (P) Bryda 650
  alloys; Electric furnace for melting ——. (P) Stassano and Petinot 554
  alloys; Influence of titanium on some ——. Bensel 261
  alloys; Process for producing ——. (P) Bryda 598
  -aluminium alloys; Influence of nickel on some ——. Read and Greaves 316
  ashes or chippings; Treatment of ——. (P) Bourgeot 836r
  -bearing concentrates; Blast-furnace for smelting ——. Honeyman 867
  Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  and carbon; Manufacture of agglomerates of reduced ——. (P) Aarts 697
  Chemical concentration of ——. (P) Bradley 1161
  Colouring —— grey-black with permanganate solution. Groschuff 751
  Commercial classification of refined ——. Addicks 1054
  Compound for use in welding joints in ——. (P) Canzler and Samesreuther 793
  converting; Selective ——. Selby-Davidson 315
  The crystalline structure of ——. Bragg 966
  Determination of arsenic and antimony in ——. Brownson 141
  Determination of —— colorimetrically. Hüttner 614
  Determination of —— by the iodate method. Brostrom 891
  Determination of —— iodometrically. Lander and Geake 376
  in drinking water; Colorimetric determination of ——. Reese and Drost 661
  Effects of repeated re-melting on ——. Clements 966
  Electric furnace for melting ——. (P) Stassano and Petinot 554
  Electrolytic process for extracting —— from ores. (P) Hybinette 359, 361*r*
  Electrolytic production of ——. (P) Hybinette 205, 361*r*, 361*r*
  Electrolytic refining of auriferous and argentiferous —— at Lithgow, N.S.W. Blakemore 202
  Extraction of ——. (P) Chittenden 927
  Extraction of —— from carbonate and oxide ores. (P) Ellis 1214
  Extraction of —— from complex sulphide ores. (P) Fiévet 321
  Extraction of —— especially from low-grade ores and other products. (P) Borchers and Pedersen 755*r*
  Extraction of fractions rich in —— from cupriferous ores and gangues. (P) "Azurit" Vegyi Ipar Részvenytársaság 969
  extraction; Recovery of values from the leach water of ——. (P) Hall, and Pennsylvania Salt Manufacturing Co. 1058
  Formation of arsine in the electrolytic refining of ——. Pyne 966
  Furnaces for use in the metallurgy of ——. (P) Addicks and Brower 144, 836
  goods. Board of Trade Bulletin 1213
  group of elements; Analytical separation of the —— from the tin group. Curtman and Marcus 712
  Hydro-metallurgy of ——. (P) Weidlein, and Metals Research Co. 359
  Impurities in cathode ——. Addicks 1158
  Influence of movement on the solution of —— in nitric acid. Drapier 261
  Influence of temperature and pressure on the oxidation of ——. Berger 648
  Influence of titanium on ——. Bensel 261
  Manufacture of boron- ——. (P) Gleason 488
  matte; Bessemerising ——. (P) Herreshoff, and Nichols Copper Co. 870
  mattes; Treatment of —— in the basic converter at the works of Karabach, Urals. Kolasnikow 596
  Metallurgy of —— in the basic converter. De Saint-Seine 316
  Method of welding ——:
    (P) Reigle and Zajic 794
    (P) Suzuki 205, 795*r*, 970*r*

  nickel, and aluminium; Alloys of ——. Guillet 358
  -nickel-gold alloys; Ternary ——. De Cesaris 261
  -nickel-gold-silver alloys; Quaternary ——. Parravano 1092
  and nickel; Hardness and modulus of elasticity of isomorphous mixtures of ——. Kurnakow and Rapke 752
  -nickel-iron alloy; Manufacture of a ——. (P) Clamer 319
  -nickel-lead alloys; Ternary ——. Parravano 1212
  -nickel-manganese alloys; Electrical resistance and temperature coefficient of ——. Gray 792
  -nickel matte; The roasting of ——. Kern and Merris 142
  -nickel ores; Chloridising the Sudbury ——. Carpenter 696
  ore in Scotland 358
  ore or slag; Extraction of cobalt or nickel from ——. (P) De Burlet 1014
  ores; Electric furnace for reducing ——. (P) Hampton, and Conley Electric Furnace Co. 794
  ores; Hydro-electric treatment of ——. Goodrich 1012
  ores; Leaching and electrolytic treatment of —— at Chuquicamata, Chile. Smith 1011
  ores; The leaching of oxidised —— by modified Dorr classifiers at the Butte-Duluth mine. Herzig 596
  ores; Preparation of very finely divided —— for oil flotation. (P) Wolf 793
  ores; Process of chloridising ——. (P) Ledoux 88
  ores; Process for smelting and briquetting ——. (P) Colley 794
  ores; Treatment of ——. (P) Hovland and Frankforter 794
  ores; Treatment of —— and recovery of their values. (P) Vadner 1058
  ores or waste; Treatment of ——. (P) Bourgeot 836*r*
  Oxidation and reduction of ——. Joannis 751
  Physico-chemical studies on ——. Cohen and Helderman 597
  Precipitation of —— from solution. Laist and Frick 922
  Preparation of finely divided ——. (P) Craig, and Spence and Sons, Ltd. 425
  Process of coating steel or iron with ——. (P) Sheaffer 1214
  Process of hardening ——:
    (P) McLarty 31
    (P) White 836*r*
  Process for refining ——. (P) Rockey and Eldridge 597
  Process for rendering —— non-oxidisable. (P) Gilson, and General Electric Co. 489
  Process for separating —— from nickel and cobalt. (P) Hybinette 794
  Process for soldering ——. (P) Autogenwerk Sirius 205, 836*r*
  Production of adhesive coatings of —— on iron and steel. (P) Cowper-Coles 793
  Production and refining of ——. (P) Frumkin 1161
  products; Leaching of —— at the Steptoe Works, U.S.A. Austin 1158
  Rapid electrolytic separation of —— from arsenic. Sieverts and Wippelmann 648
  Reaction for ——. Malatesta and Di Nola 335
  Recovery of —— from its ores and solutions. (P) Sulman, Picard, and Minerals Separation, Ltd. 488
  refining; Ampère efficiency in electrolytic ——. Guiterman 923
  refining; Cathode potential in ——. Guiterman 1054
  refining; Treatment of anode residues from ——. (P) Keller 1015
  Resistivity of —— in temperature range 20° C. to 1450° C. Northrup 141
  Separation of bismuth from ——. (P) Thum, and United States Metals Refining Co. 794
  Separation of —— from sulphide or oxide ores, etc. (P) Borchers and Menzel 870
  smelting furnaces; Coal-dust firing for reverberatory ——. Mathewson 1093
  Specific heat of —— in the interval 0°—50° C. Harper 923
  Tensile properties of —— at high temperatures. Bengough and Hudson 923
  Test for ——. Oliver 885
  from tin and antimony; Use of hydrofluoric acid for separating —— by means of electric current. McCay 1117
  -tin bronzes; Electrolytic separation of —— and their investigation. Kremann and others 553
  -tin and copper-zinc alloys; Effect of annealing on quenched ——. Portevin 553
  Transparence or translucence of the surface film produced in polishing ——. Beilby 318
  Treatment of ——. (P) McLarty 31
  and the war 1093
  welding; Process for ——:

Covering medium from waste sulphide lyes; Manufacture of a ——. (P) Müller 478
Crape; Manufacture of —— from cotton or thread made from cellulose. (P) Courtaulds, Ltd., and Gilles 1152
Crayons; Composition for making coloured artists' ——. (P) Herda 149
Crazing of white ware; Method of testing delayed ——. Harkort 80
Cream; Apparatus for pasteurising ——. (P) Tödt 709
  Detection and determination of benzoic acid in ——. Hinks 37
  Electrical treatment of —— during churning. (P) Combe 435
  Method of homogenising ——. (P) Brawner 1069
  Process and apparatus for sterilising ——. (P) Nelsen 882
  Process for producing ——. (P) McCaddon and De Witt 371
  Rapid determination of fat in ——. Kropat 498
Creatine; Colorimetric determination of ——. Baur and Trümpler 659
Creosote; Conversion of —— into pitch. (P) Rosen 246
  oil as a wood preservative; Report of Committee of American Wood Preservers' Assoc. on —— 832
  for preserving wooden fences; Use of coal-tar ——. Collins and Hall 466
  in well preserved timbers; Quantity and character of ——. Alleman 832
Creosoting industry; Use of refined coal tar in the ——. Von Schrenk and Kammerer 833
Cresol; Process for separating *m*- and *p*- ——:
    (P) Schulke und Mayr 246
    (P) Terrisse 413
Cresols and formaldehyde; Infusible condensation products of ——. (P) Baekeland, and General Bakelite Co. 430
Cresotinic acids; Alkylalkoxymethyl esters of ——. (P) Bayer und Co. 375*r*, 569*r*
Crocetin. Decker 664
Crop; The effect of one —— on another. Duke of Bedford and Pickering 1065
Crops; Chemical, electrochemical, and electrical treatment of ——. (P) Mies 432
Crotonic aldehyde; Manufacture of ——. (P) Consortium f. Elektrochem. Industrie 219
Crowa fibre from British Guiana 476
Crucible. (P) Jeppson, and Norton Co. 81
  furnaces; Electric ——. (P) Calhane 491
  furnaces; Gas-heated ——. (P) King and others .. 926
  Glazed ——. (P) Malm, and Norton Co. 81
Crucibles; Recovery of graphite from worn-out ——. (P) Teichmann 24*r*
  Zirconia ——. Ruff and Lauschke 647
  from zirconium dioxide; Production of ——. Ruff and others 593
Crushing calcium carbide; Process for ——. (P) Landis, and American Cyanamid Co. 788
  mills. (P) Allen and Co., Ltd., and others 126
  mills for ores, etc. (P) King, and Head, Wrightson, and Co., Ltd. 319
  mills; Roller and ring ——. (P) Gebr. Pfeiffer 241, 408
Crystallisation of hot saline solutions; Continuous ——. (P) Häberlein 409
  Method of inducing spontaneous ——. Tammann 691
Crystallising apparatus, especially for sugar manufacture. (P) Tiemann 367*r*
  apparatus; Hydraulic gear for vacuum ——. (P) Maschinenfabr. Fritsch u. Sohn 14
  hot-saturated saline solutions; Apparatus for ——. (P) Sauerbrey Maschinenfabrik 484
  in motion; Apparatus for ——. (P) Bühler .. 188, 470
  salts and the like from solutions by cooling; Process for ——. (P) Fromme 681
  substances which are only slightly soluble in water: Process and apparatus for ——. (P) Rousseau .. 633

PAGE

Crystals ; Apparatus for obtaining large, well-formed —— from hot-saturated solutions. (P) Schütze 342
  Apparatus for separating large —— from hot solutions. (P) Gewerkschaft Carlsfund 188
  Production of large —— by crystallisation in motion from solutions and fused masses. (P) Elektrochemische Werke 822

Cuba ; Trade of —— in perfumery and essences 1073

Cuban pine (*Pinus heterophylla*) ; The leaf and twig oils of ——. Schorger 983

Cultivation ; Electric ——. Löb 1022

Cultures ; Preparation of ——. (P) Nicolle 666

Cupellation beads ; Detection of platinum metals in ——. Bannister and Patchin 29
  losses. Loevy 141

Cupola furnace. (P) Schürmann 1059*r*
  furnace ; Gas-fired ——. (P) Gautier and Esselin 88
  furnaces ; Explosions in —— and a safety device for avoiding them. Osswald 1054
  furnaces ; Preventing formation of carbon monoxide in ——. (P) Schürmann 361*r*

Cupolas. (P) Tropenas and Tournier 490*r*

Cuprammonium solutions ; Preparation of ——. (P) Borzykowski 746*r*

Cupric cholate ; Preparation of ——. (P) Knoll und Co. 668
  oxide jellies. Finch 199

Cupro-carbonite ; Manufacture of ——. (P) Aarts 697

Cuprous chloride ; Process of reducing ——. (P) Laist 969
  oxide ; Colloidal ——. Paal and Dexheimer 787
  oxide and silver. Mathewson and Stokesbury 315

***iso*-Curcumin** ; Synthesis of an ——. Heller 544

Cus-cus oil of India. Singh 886

Customs Tariff for Southern Rhodesia, 1914 ; Proposed New —— 1174
  Tariff of the Union of South Africa, 1914 846

Cyanamide ; Apparatus for producing ——. (P) Weaver 593
  Manufacture of dialkali ——. (P) Chem. Fabr. von Heyden 136
  Polymerisation of —— to dicyandiamide in aqueous solution. Grube and Krüger 75
  Production of ——. (P) Bayer und Co. 831*r*
  Volumetric determination of ——. Grube and Krüger 690

Cyanhydrins of aldehydes and ketones ; Preparation of selenium derivatives of ——. (P) Albert 667, 880, 985

Cyanidation ; Experiments in ——. Cohen 29
  Filtering slimes in ——. Megraw 648
  Slimes agitation for ——. Megraw 83

Cyanide in electroplating solutions ; Determination of free ——. Lundell 596
  precipitate ; Treatment of ——. Megraw 423
  process ; Leaf of vacuum filters for the ——. (P) Ohtsuka 1058
  solutions ; Electrolysis of ——. Kern 357
  solutions ; Method of aerating ——. (P) Darrow 87
  solutions ; Molybdenum in ——. Clennell 315

Cyanides ; Action of alkali and alkaline-earth —— on dextrose. Rupp and Hölzle 96
  Detection of —— in presence of ferrocyanides, ferricyanides, and thiocyanates. Barnebey 690
  Electrolysis of aqueous solutions of simple alkali ——. Clevenger and Hall 357
  Manufacture of —— :
    (P) Bucher 692, 749
    (P) Dreaper 788
  Manufacture of —— by the Margueritte and Sourdeval process. (P) Gros and others 23

Cyaniding a furnace product (speiss containing silver). Megraw 922
  Hydrated lime for ——. Meade 833
  Use of lime in ——. Merton 202

Cyanogen ; Catalytic combustion of —— to nitric oxide. Moldenhauer and Wehrheim 748
  from coal gas ; Separation of ——. (P) Bergh 542
  Production of gases containing —— in the electric arc. (P) Konsortium f. Elektrochem. Industrie 200

Cyanogen compounds ; Manufacture of alkali ——. (P) Clancy, and Portland Gold Mining Co. 1088
  compounds ; Process for preparing ——. (P) Bucher, and Nitrogen Co. 692, 1207*r*
  compounds ; Synthetic production of ——. (P) Bucher 137*r*

Cyanogenetic plants of New South Wales. Petrie 982

***o*-Cyanophenol** ; Nitro- and amino-derivatives of ——. Cousin and Volmar 1004

Cyclohexane and its homologues ; Process for purifying ——. (P) Bayer und Co. 807
  Mercury derivatives of ——. Grüttner 665

Cyclopentylamines ; Catalytic formation of ——. Sabatier and Mailhe 501

***Cymbopogon coloratus*, Stapf** ; Oil of —— from Fiji 766

PAGE

D

Dacryodes hexandra ; Oil of ——. Schimmel 665

Dairen ; Bean oil extracting mill at —— 837
  Soya bean and oil trade of —— 756

Dairy products ; Imported ——. Government Laboratory Report 892
  residues ; Preparation of a salutary beverage for ——. (P) Jolles 842*r*

Damascene steel ; The problem of the old ——. Guertler 140

Daniella thurifera ; Cadinene from ——. Lenz 765

Daphnandra micrantha ; Alkaloids of ——. Pyman 765

Date palm ; Products derived from the ——. Raynaud 1109
  stone oil. Diedrichs 1098

Datiscetin ; Constitution of ——. Leskiewicz and Marchlewski 638

Daviesia latifolia ; Constituents of ——. Power and Salway 435
  Presence of a dibenzoylglucoxylose in ——. Power and Salway 566

Dealcoholising liquids. (P) Overbeck 370*r*

De Beque petroleum field in Colorado. De Beque 1042

Decolorising agent for tannin extracts from soya beans ; Preparation of a ——. (P) Dammer 840
  -carbon ; Regeneration of ——. (P) Wijnberg 853
  liquids ; Process for ——. (P) Marcus 188, 583*r*
  material ; Manufacture of a —— :
    (P) Aktiebolaget Kolm 1083
    (P) Hellsing 1144*r*

Decomposing apparatus. (P) Miguet 65

Defecant and process of making same. (P) Wayte, and American Agricultural Chemical Co. 367

Defecator. (P) Cresswell 36

Degreasing raw or manufactured fibrous materials by means of fat-solvents ; Process for ——. (P) Netz und Co. 72, 478*r*

Dehydrating apparatus. (P) Joseph 1081
  colloidal substances ; Process for ——. (P) Richter und Richter 342
  fats, oils, hydrocarbons, and similar liquids ; Method of ——. (P) Hering 757
  machines. (P) Robinson 341

Deliquescence of salts of ammonium bases. Peddle 571

Delta metal ; Analysis of —— by the electrolytic method. Belasio and Marchionneschi 423

N-Demethylocodeine. Diels and Fischer 765

Denitrification in arable soils ; Influence of organic matter on —— :
    Barthel 759
    Kossowicz 841

Density of gases ; Apparatus for measuring the ——. (P) Bomhard and König 336, 770*r*, 945*r*
  of gases, liquids, and solids ; Determination of the ——. (P) Kalähne 163
  regulator for use in making sulphuric acid and other purposes. (P) Santa 199, 485*r*
  of some molten metals and alloys ; Determination of the ——. Arpi 142

Deodorising solids, liquids, and gases ; Process for ——. (P) Marcus 188, 583*r*

Depilating ; Notes on ——. Rogers 152

Deposits ; Process and apparatus for applying —— to surfaces. (P) Morcom 968

Desiccating air or gases. (P) Soc. l'Air Liquide 907, 908*r*
  Apparatus and process for ——. (P) Merrell, and Merrell-Soule Co. 127
  aqueous animal or vegetable liquids by means of anhydrous sodium sulphate. (P) Niegovan 823
  and collecting apparatus. (P) Merrell, and Merrell-Soule Co. 408
  fluid substances ; Method for ——. (P) McLaughlin 409*r*
  gases ; Process of ——. (P) Patitz, and Allis-Chalmers Manufacturing Co. 1081
  liquids ; Apparatus for ——. (P) Gray and Jensen 13
  liquids, etc. ; Process and apparatus for ——. (P) Töpfer 63
  milk ; Machine for ——. (P) Thardy 215
  Process of ——. (P) Gray and Jensen 999

Destructor furnace ; The evolution of the ——. Kohlmann 383
  furnaces. (P) Atterbury and Matthews 764
  furnaces or stoves. (P) Thomas 842

Desulphurising ores and like material. (P) Weeks, and Dwight and Lloyd Sintering Co. 755*r*
  process at the Nipissing Mill, Ontario 696

Detinning ; Process of —— :
    (P) Savage 1095
    (P) Von Kügelgen and others 320
    (P) Weber 1161

Detonators ; Manufacture of ——. (P) Claessen 44

Dextrin ; Manufacture of ethers of ——. (P) Lilienfeld 958
  Production of —— from cassava starch. (P) Riboud and Ahnert 327
  Solubility of ——. Lewis 495

PAGE

- Dextrins; Action of some amylases on ——. Gruzewska .. 880
  - Behaviour of starch —— to different yeasts. Von Friedrichs 328
- Dextrose; Absorption of —— by bone-black. Morton 1022
  - Action of alkali and alkaline-earth cyanides on ——. Rupp and Hölzle 96
  - Action of ammoniacal copper hydroxide on ——. Windaus and Ullrich 561
  - Adsorption of ——. Rona and von Tóth 705
  - Determination of —— by the copper iodide method. Cole 657
  - Determination of —— by means of sodium hypoiodite. Bland and Lloyd 949
  - Formation of acetaldehyde by anærobic fermentation of —— by *B. coli communis* (Escherich). Grey 608
  - in leather: Determination of ——. Veitch and Rogers 1064
  - Reduction products of ——. Glucal and hydroglucal. Fischer 211
- Diacetates; Preparation of —— from dibromides. Bainbridge 1027
- Diacetone-alcohol; Preparation of ——. (P) Hoffman, and Alco Dco Co. 103
- Diacetylpropane from caoutchouc. Harries 364
- Dialkali cyanamide; Manufacture of ——. (P) Chem. Fabr. von Heyden 136
- CC-Dialkylbarbituric acids; Preparation of halogenated ——. (P) Einhorn 667
- Dialkyloxyarylaminopropanes or their N-monoalkyl derivatives; Preparation of ——. (P) Merck 807
- Diallyl series; Polymerisation of hydrocarbons of the ——. Lebedeff 1224
- Dialysing membranes; Preparation of ——. (P) Hömberg and others 302, 822
- *p*-Diamines; Affinity of —— for fibres. Franěk 546
  - Preparation of sulphonaphthylated aromatic ——. (P) Meister, Lucius, und Brüning 544
- 3.6-Diaminoacridine and its alkyl derivatives; Production of ——. (P) Cassella und Co. 194
- 1.4-Diaminoanthraquinone and its derivatives; Preparation of sulphuric acid compounds of ——. (P) Bayer und Co. 194
- Diaminoanthraquinones; Preparation of α-nitro compounds of acylated ——. (P) Bayer und Co. 246
- 4.4′-Diaminodibenzyl sulphide and its derivatives; Preparation of ——. (P) Chem. Fabr. vorm. Weiler-ter Meer 637
- Diaminodihydroxyarsenobenzene; Manufacture of alkali salts of —— in combination with copper and silver. (P) Meister, Lucius, und Brüning 942, 1226*r*
- 3.3′-Diamino-4.4′-dihydroxyarsenobenzene; Application to suspend a patent for —— 1028
  - Preparation of ——. (P) Meister, Lucius, und Brüning 568
  - Preparation of derivatives of ——. (P) Meister, Lucius, und Brüning 568
- 3.3′-Diamino-4.4′-dihydroxyarsenobenzene-formaldehyde sulphoxylates; Rendering stable aqueous solutions of ——. (P) Kaufmann and Vieth 438
- Diaminodiphenylurea; Preparation of a chloro-substituted ——. (P) Meister, Lucius, und Brüning 221
- Diamino-di-*p*-xylylmethane from technical xylidine; Preparation of ——. (P) Meister, Lucius, und Brüning.. 474
- Diaminoguanidine; Preparation of ——. Pellizzari and Gaiter 941
- Diaminoketones; Preparation of aliphatic ——. (P) Bayer und Co. 43*r*, 103, 613*r*
- Diaminotetranitro-arsenobenzene; Manufacture of a ——. (P) Boehringer und Söhne 438
- Diamonds in New South Wales; Occurrence and distribution of ——. Grove 731
- Dianisidine Brown (Ortamine D Brown). Schmid 479
- Dianthraquinonylaminecarboxylic acids; Preparation of ——. (P) Badische Anilin und Soda Fabrik 193
- Diaphragm for electrochemical and electro-osmotic purposes. (P) Ges. f. Elektro-Osmose 427, 796*r*
- Diarylethers; Process for preparing ——:
  - (P) Fritzsche und Co. 102
  - (P) Ostermann 767*r*
- Diaryl ketones; Direct catalytic hydrogenation of ——. Sabatier and Murat 347
- Diarylurea chlorides; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 825
- Diarylureas; Manufacture of —— (P) Meister, Lucius, und Brüning 219
- Diastase; Action of —— on starch granules. Baker and Hulton 760
  - of alfalfa; Investigation of the ——. Shney 1167
  - Process for obtaining pure ——. (P) Fränkel 214*r*
- Diastatic power of malt extracts; Determination of the ——. Monnier 271
  - preparations; Manufacture of ——. (P) Cross and others 213
- Diazo compounds; Action of nitrogen peroxide on aliphatic ——. Wieland and Reisenegger 955

PAGE

- Diazo—*cont.*
  - compounds; Combination of —— with phenols and phenol-ethers. Meyer and others 687
  - derivatives; Action of —— on vegetable oils. Sisley and Frehse 362
  - salts in a solid form; Method of producing ——. (P) Cassella und Co. 743
  - solutions for printing; Improving the keeping qualities of ——. Justin-Mueller 133
- Diazo-phenols; Constitution of the ——. Klemenc 587
- Diazotisation of various amines; Velocity of ——. Tassilly 247
- Dibenzanthrone; Derivatives of —— and vat dyestuffs derived therefrom. (P) Badische Anilin und Soda Fabrik 71, 828*r*
- Dibenzoylglucoxylose, a natural benzoyl derivative of a new disaccharide. Power and Salway 566
- Dibromomenthone; Structure of ——. Cusmano 101
- Dicalcium phosphate; Production of ——. (P) Electric Smelting and Aluminium Co. 270*r*
- Dichloroanthraquinones; Preparation of ——. (P) Meister, Lucius, und Brüning 544
- α-Dichlorhydrin; Manufacture of the carbamic acid ester of ——. (P) Beckmann, and Dr. Bruno Beckmann Chem. Fabr. 439, 985*r*
- Dichlorohydrocarbons; Acetylation of ——. (P) Masland, and du Pont de Nemours Powder Co. 844
- Dicyanodiamide; Polymerisation of cyanamide to —— in aqueous solution. Grube and Krüger 75
  - Technical methods of obtaining —— from calcium cyanamide, from the strandpoint of chemical kinetics. Grube and Nitsche 749
- Didymiums; Action of bromine on the ——. Browning .. 691
- Die-casting practice; Modern ——. Pack 967
- Diethylacetyl isocyanate. (P) Callsen, and Synthetic Patents Co. 889
- Diffusion juice; Acidity of ——. Pellet 35
  - process and apparatus. (P) Naudet 878
  - processes; Use of —— in preparation of pure substances. Johnston 134
- Diformal peroxide hydrate. Fenton 888
- Digester. (P) Zinkeisen and Riddle 342
- Digestive ferments; Assay of ——. Graber 612
- *Digitalinum verum.* Kiliani 1071
- Digitonin compound of oxycholesterol. Lifschütz and Grethe 929
- Digitoxin. Kiliani 216
- Dihalogen-carbazoles; Preparation of nitration products of ——. (P) List 826
- Dihalogen-paraffins; Manufacture of ——. (P) Matthews and Bliss 806
- Dihydro-anthracene; Preparation of —— by means of sodammonium. Lebeau and Picon 913
- Dihydrohydrastinine; Conversion of —— into hydrastinine. (P) Bayer und Co. 220
- β-Dihydrolimonene. Semmler and Feldstein 275
- Dihydroxyanthraquinones; Examination of —— with reference to their dyeing properties. Hüttig 589
- Dihydroxybenzene-arsinic acid; Preparation of a ——. (P) Meister, Lucius, und Brüning 567
- *m*-Dihydroxybenzene-arsinic acid; Preparation of ——. (P) Meister, Lucius, und Brüning 667
- 1.2-Dihydroxybenzene-4.6-disulphonic acid; Preparation of ——. (P) Saccharinfabr. A.-G. vorm. Fahlberg, List und Co. 1044
- Dihydroxydiaminoarsenobenzene and silver; Compound of halogens with ——. Danysz 275
- Dihydroxydibenzal-acetone (lygosine) as a new indicator. Ferenez 1075
- 2.8-Dihydroxy-1.7-dimethylpurine and 2.8-dihydroxy-1.7.9-trimethylpurine. Johns 275
- 1.6-Dihydroxynaphthalene; Action of phthalic anhydride on ——. Fischer and König 956
- 6.6′-Dihydroxynaphthofluoran; Preparation of ——. Fischer and König 956
- 1.6-Dihydroxynaphthophthalein and its use as an indicator. König 1084
- Dihydroxy-1.4-naphthoquinones; The 2.6- and 2.7- ——. Dimroth and Kerkovius 957
- 1.4-Dihydroxy-2-nitroanthraquinone; Manufacture of ——. (P) Bayer und Co. 19, 306*r*
- 1.2-Dihydroxy-3-nitro-4-methylanthraquinone from 1.4-chloromethylanthraquinone; Formation of ——. Fischer and Rebsamen 306
- *o*-Dihydroxyphenyl-α-propanolamine; Preparation of optically active. (P) Bayer und Co. 277
- β-3.4-Dihydroxyphenyl-α-aminopropionic acid; Preparation of ——. (P) Hoffmann-La Roche und Co. 943
- 1.5-Diketones; Action of sodamide on ——. Bauer 711
- Dimethylallene; Transformation of —— into isoprene. Kutscherow 333
- Dimethylamine; Preparation of ——. (P) Bayer und Co. 42, 613*r*

accumulators; Preparation of a mass for the positive electrodes of alkaline ——. (P) Svenska Ackumulator Aktiebolaget Jungner 871, 971*r*
accumulators; Production of highly porous electrodes for ——. (P) Gebr. Stanislaw und Georgij Gaszynski. Apoznanski und Co. 971
accumulators; Restoring the activity of positive electrode masses of alkaline ——. (P) Svenska Ackumulator Aktiebolaget Jungner 796, 872*r*
accumulators; Solution for the cells of lead ——. (P) Rabbidge 322, 651*r*
apparatus; Electrode material for vapour ——. (P) Jackson, and Westinghouse Electric and Manufacturing Co. 796
arc lamps; Carbon electrodes for ——. (P) Conradty 913, 913*r*
arc lamps; Electrodes for ——:
(P) General Electric Co., and others 130*r*, 130*r*, 543*r*, 543*r*, 854
(P) Lewia 543, 825*r*
arc; Generation of heat by means of the ——. (P) Rennerfelt 599, 837*r*
arc-light carbons. (P) Ayrton 346, 686, 854 1150*r*
arc light electrodes. (P) Ladoff and Edmonds 1044
arc; Method of heating substances uniformly in the ——. (P) Von Wilmowsky and Pieper 555
arc; Production of a gas with preservative properties by means of the ——. (P) International Ionizing Process Co. 427
arc; Production of reactions in gases by the ——. (P) Badische Anilin und Soda Fabrik 146*r*
arcs; Production of long, continuous ——. (P) Schönherr and others 602*r*, 1162*r*
batteries. (P) De Mello 601
batteries or accumulators; Packing material for ——. (P) Sablon 650
batteries; Electrodes for primary and secondary ——. (P) Barbier 490
batteries; Plates for primary or secondary ——. (P) Hancock and David 1096
battery. (P) Achenbach 756*r*
battery cell. (P) Thomas 427
battery compounds. (P) Cook Railway Signal Co. 265
battery plates; Process and apparatus for treating ——. (P) Rabenalt, and Gould Storage Battery Co. 928
battery; Primary ——. (P) Yai 89
cells:
(P) Achenbach 871
(P) Burger 928
(P) Kaplan 1017
cells; Commercial preparation of mercurous sulphate for normal ——. Warburg 700
cells; Electrolytic material for ——. (P) Lessing 427
cells; Porous containers or diaphragms for ——. (P) Lucas 928
cells with sealed covers; Apparatus for testing the specific gravity of acid in ——. (P) D.P. Battery Co., Ltd., and Elliott 795
cells; Standard ——. National Physical Laboratory Report 892
condensers:
(P) Aylsworth, and Halogen Products Co. 1059
(P) Thomas, and Westinghouse Electric and Manufacturing Co. 1059
conduction at high temperatures, and its measurement. Northrup 1013
conductivity of saline solutions; Portable apparatus for measuring the ——. Saviron 1228
conductors. (P) Allen and others 1096
conductors composed of graphite and metal; Manufacture of ——. (P) Preuss 321
cultivation of plants. Löb 1022
currents; Chemical action stimulated by alternating ——. Brown 426
discharge; Ignition of gaseous mixtures by the ——. Coward and others 541
discharge used in recent agricultural experiments; Distribution of the overhead ——. Jorgensen and Priestley 1066
discharges in gases; Method and furnace for securing products of ——. (P) Von Koch 265*r*
discharges in gases; Production of continuous or constant ——. (P) Von Koch 1162*r*
discharges; Production of neon and helium by ——. Collie and others 1067
discharges; Treatment of fluids by means of static ——. (P) Weston 601
dry batteries. (P) Hubert 427
dry batteries; Preparation of absorbents for use in the cells of ——. (P) Rabbidge 89, 265*r*

internal-combustion; Increasing the efficicacy of petrol or like fuel in ——. (P) Birtill 853
internal-combustion; Liquid fuel for ——. (P) Terry 344
internal-combustion; Manufacture of fuel for ——:
(P) Gulick 244
(P) King 853
Manufacture of liquid fuel for internal-combustion ——. (P) Andrews 586
Method for economising fuel and preventing carbon deposits in explosion ——. (P) Nedoma and Fletcher 1002
Treatment of liquid fuel for internal-combustion ——. (P) Heyl and Baker 586
Use of heavy oils (tar, tar oil) in internal-combustion ——. Drexler 1146
Ensilage process; Effects of the —— on the solubility of "floats." Forbes and Fritz 370
Enzyme action; Constancy of the optimum temperature of —— under varying concentrations of substrate and of enzyme. Compton 977
action; Nature of the different kinds of inhibition of ——. Michaelis and Rona 272
of rennet; Conditions of activity of the ——. Michaelis and Mendelssohn 98
work; Tricresol as a substitute for toluene in ——. Graves and Kober 496
Enzymes of *Aspergillus oryzae*. Takamine 1068
of *Chilidonium* seeds. Bournot 797
Chemical composition and formation of ——. Euler and Dernby 368
of honey. Gothe 1217
Inorganic —— and their application for baking purposes. (P) Weil 802
of oxidation; Theory of ——. Woker 444
Proteolytic ——. Herzfeld 707
Specific action of —— with regard to their synthetic properties. Bourquelot 706
of yeast; Susceptibility of the various —— to thermoregeneration. Bertrand and Rosenblatt 1104
of washed zymin and dried yeast:
Harden and Norris 658
Harden and Zilva 761
Eosin; Action of aniline on ——. Scharwin 70
Action of —— on bacteria, ferments, and mould fungi. Zeiss 1111
The copper lakes of ——. Gilbert 1199
Ephedrine and pseudoephedrine. Schmidt 664
Epicamphor; *d*- and *dl*- ——. Furness and Perkin 983
l-Epicamphor. Bredt and Perkin 101
Epilobium angustifolium; Production of textile fibre from ——. (P) Schumann 308
Ergot; Acetylcholine, a new active principle of ——. Ewins 664
Ermine; Bleaching ——. (P) Gabriel-Claude and Bricard 860
Eruca sativa, Mill.; Oil-seeds and oil of ——. 147
Erythrene, its homologues and derivatives; Manufacture of ——. (P) Bayer und Co. 43*r*, 569*r*
hydrocarbons; Manufacture of ——. (P) Ostromislensky 985*r*
Preparation of —— from derivatives of ethyl ether. Ostromysslenski and Kielbasinski 766
Process for preparing ——. (P) Gerlach and Koetschau 103
Eseroline. Straus 40
Esparto grass; Bleaching —— for paper making. (P) Dobson 20
grass; Commercial importance of ——. Koch 248
Essences; Cuban trade in —— 1073
Esterification in mixed solvents; Catalytic influence of hydrochloric acid on ——. Kailan 1115
Esters of aromatic carboxylic acids; Preparation of ——. (P) Badische Anilin und Soda Fabrik 221
in essential oils; Determination of ——:
Béhal 765
Niviere 886
of fatty acids; Use of —— for carburetting, heating, etc. (P) Soc. d'Etude du Carburol 191
of high molecular weight; Preparation of —— and their use in printing alizarins. (P) Mollard and Cumet .. 641
Preparation of acid —— from esters lower in hydrogen. (P) Wimmer 568
of the terpene series; Manufacture of therapeutically active ——. (P) Kalle und Co. 806
of tertiary alcohols; Preparation of ——. (P) Neumann und Co. 845
of unsaturated fatty acids; Conversion of —— into saturated compounds:
(P) Bedford and Williams 324
(P) Bedford and others 429*r*
(P) Nordiske Fabriker De-No-Fa Aktieselskap .. 324
of unsaturated fatty acids; Process for hydrogenising ——. (P) Maryott 702
Estland; Composition of the bituminous rocks of —— and of their decomposition products. Fokin 1082
Etching mild steel; Reagent for ——. Rosenhain and Haughton 551

  solutions or emulsions ; Apparatus for ——. (P) Schröder 681
  sugar juices ; Apparatus for rapidly —— under low pressures. (P) Portemont 879

Evaporation ; Continuous ——. (P) Prager 633r
  Experimental study in multiple effect ——. Deerr 168
  in a vacuum pan ; Rate of ——. Deerr 606

Exhaust gases ; Apparatus for removing dust from ——. (P) Valeur 1081
Expedite ; Composition of —— 103
Expenditure of the Society during 1913 619
Exploding by liquid air, liquid oxygen, or similar liquefied gas. (P) Simonis 1116
Explosion of acetylene from calcium cyanamide in Trieste Harbour. Morpurgo 482
  in a dyestuff plant in the United States 1151
  in an incorporating house at Ardeer ; Circumstances of an ——. Cooper-Key 668
  of mixtures of ammonia and air. Schlumberger and Piotrowski 1087
  of nitro-compounds. Uhlmann 376
  of nitroglycerin in a cordite stove at Cliffe ; Report on an ——. Coningham 768
  of starch dust. Grosvenor 60
  at the works of the Akt.-Ges. f. Anilinfabr., Rummelsberg 376, 712
Explosions in beet slice dryers. Albrecht 433
  Dust ——. Report of Inspector of Factories and Workshops 894
  Electric main ——. Report of Board of Trade Enquiry 808
  in liquid air plants. Bramkamp 240
  in Mines Committee ; Sixth report of the —— 1144
  in mines ; Method and means for suppressing —— by the use of non-combustible dust. (P) Cremer 584
Explosive cap compositions which do not cause rusting in rifle barrels. Mertens 278
  cartridges containing liquid oxygen. (P) L'Air Liquide Soc. Anon. 376
  charges for mining and military purposes ; Manufacture of ——. (P) Claessen 222r
  charges for mining and military purposes ; Process of detonating ——. (P) Claessen 44, 845r
  coated with antimony sulphide ; Granulated ——. (P) Hibbard, and Du Pont de Nemours Powder Co. 1036
  compounds. (P) Burrows and Burrows 1227
  compounds ; Manufacture of ——. (P) Waddell, and Hoynes Safety Powder Co. 944
  gases ; Device for detecting ——. (P) Accumulatoren-Fabrik 846
  limits of mixtures of gases and air ; Lower ——. Somermeier 343
  mixtures which can be detonated directly ; Preparation of ——. (P) Ver. Köln-Rottweiler Pulverfabr. 278
  powder ; Apparatus for forming —— into spherical grains. (P) Du Pont 943
  powder ; Black —— glazed with aluminium. (P) Sparre, and Du Pont de Nemours Powder Co. 1227
  priming charge. (P) Buell, and Winchester Repeating Arms Co. 944
  priming compositions :
    (P) Claessen 335r
    (P) Jaques, Wells, and Nobel's Explosives Co., Ltd. 891r
  substance containing arsenic. Müller 748
  substances ; Electrostatic separators for treating ——. (P) Kraus 681
Explosives :
    (P) Charbonneaux 569
    (P) Hoynes 1227
    (P) Kolowratnik 44r
    (P) Nathan and others 441r, 712
    (P) Rauzières 614
    (P) Silberrad 504r, 845r
    (P) Voigt 614r
  38th Annual Report of H.M. Inspectors of —— 1172
  Annual Report of the Chief Inspector of —— for the Union of South Africa, 1913. Denne 943
  in coal mines. Home Office Order 986
  in coal mines ; List of permitted —— 103, 334
  Composition of newly permitted —— 103
  The heat test of ——. Egerton 112
  Heat test of ——. Report of Departmental Committee to Home Office 441
  Heat-test Committee 337
  made with liquid air or liquid oxygen. (P) Claude, and Soc. L'Air Liquide 1036r
  Manufacture of —— :
    (P) Claessen 376, 669r
    (P) Von Tarnow 569
  Manufacture of gelatin ——. (P) Vergé 943
  Manufacture of plastic ——. (P) Herlin 614
  for mining ; Specific gravity separation applied to the analysis of ——. Storm and Hyde 1227

- Explosives—*cont.*
  - Process of varying the velocity of detonation of ——. (P) Woodbury, and Du Pont de Nemours Powder Co. 1116
  - Production of —— in the United States in 1912. Fay 768
  - Safety ——. (P) Herz 44
  - Smokeless powder; Manufacture of ——. (P) Guiguet 376
  - Smokeless powders; Experiments on the ignition of large quantities of —— at Schlüsselberg. Saposchnikow 668
  - Smokeless powders; Manufacture of ——. (P) Claessen 614
  - Smokeless powders with a nitrocellulose base; Manufacture of ——. (P) Joliot 987
  - of the Sprengel type; Manufacture of ——. (P) Hawkins 222, 569*r*
  - Supplementary list of permissible —— in the United States 1075
  - in the United States; Production of ——. U.S. Bureau of Mines 1172
  - Use of 2.4.6.2′.4′.6′- hexanitrodiphenyl sulphide for making ——:
    - (P) Hartmann 161*r*
    - (P) Sprengstoff A.-G. Carbonit 44
  - Use of —— for removing obstructions in the blast furnace. Schönweg 27
  - works in Germany; Accidents and injuries to life and limb in —— 890
- Exports; Prohibited —— 810, 846, 896, 988, 1038, 1118, 1230
- Extinguishing fires; Compound for ——. (P) Snelling and others 908
- Extract; Beverage ——. (P) Post, and Postum Cereal Co. 803
  - for use in making beverages, etc.; Manufacture of a powdered ——. (P) Kellogg 803
- Extracting apparatus:
    - (P) Castona 470, 798
    - (P) Castona, and Castona Improved Process Co. 1062
  - apparatus for oil, etc. (P) Wilhelm 652*r*
  - fats or oils from bones, seeds, etc.; Process and apparatus for ——. (P) Schmidt 428
  - fats, rubber, waxes, etc., by means of solvents; Process for ——. (P) Margoles 428
  - materials by means of volatile liquids; Apparatus for ——. (P) Bonneau 188*r*
  - oil from seeds, etc., by means of a solvent; Apparatus for ——. (P) McCoid 652
  - oils; Apparatus for ——. Barnick 873
- Extraction apparatus. (P) Cary-Curr, and Sargent and Co. 163
  - apparatus; Cooler for ——. (P) Ockel 583*r*
  - apparatus, especially for use with solvents of high specific gravity. Budde 184
  - apparatus for examination of iron-gall inks; Ethyl acetate ——. Kempf 306
  - by means of immiscible solvents; Methods for —— studied from the point of view of the distribution coefficients:
    - Marden 501
    - Marden and Elliott 1171
- Extractor; Centrifugal ——:
    - (P) Beach and Braun 951
    - (P) Poland 583
  - Cylindrical vertical ——. (P) Harburger Eisen- u. Bronzewerke A.-G. 633, 737*r*
- Extracts rich in enzymes and nitrogenous matter for use in baking, medicine, etc.; Manufacture of highly active ——. (P) Hamburg 803

F

- Fabric; Manufacture of waterproof ——. (P) Jacobs 1045
  - for use in the manufacture of air-craft. (P) Weil 639
- Fabrics; Action of light on dyed ——. Harrison 689
  - Apparatus for drying ——. (P) Bradford Dyers' Assoc., Ltd., and others 419*r*
  - Apparatus for impregnating and coating ——. (P) Destribats 133
  - Apparatus for treating ——. (P) Buhl and McCausland 1007
  - Apparatus for waterproofing or applying rubber to ——. (P) Higham and Skelton 1063
  - Cause and prevention of the defect in piece-dyed —— supposed to be due to a splitting of the silk fibre. Leech 916
  - Coating woven or other —— with metal. (P) Holland and Holland 642
  - The conditioning of textile ——. (P) Joseph 1152
  - containing vegetable fibre; Production of a permanent silky lustre on ——. (P) Dutschke 860, 860*r*
  - Decoration of ——. (P) Winsor and Newton, Ltd., and Emens 917
  - Filter-press ——. (P) Carman 583*r*
  - Finishing or dressing textile —— with soapy preparations. (P) Weiss 642*r*
  - incombustible and fire-resisting; Rendering ——. (P) Böhler 309

- Fabrics—*cont.*
  - Inflammability of ——. Government test 72
  - Manufacture of crimped or embossed —— from cotton or thread made from cellulose. (P) Courtaulds, Ltd., and Gilles 1152
  - Material for rendering —— fireproof. (P) Aylsworth, and Condensite Co. of America 309
  - Method of colouring —— and apparatus therefor. (P) Rousseau 134*r*
  - for pneumatic tyre covers and balloon envelopes; Manufacture of ——. (P) Liais 957
  - Preservation of rubbered ——. (P) Muntz 974
  - Printing textile ——. (P) Levinstein, and Levinstein, Ltd. 73
  - Process for impregnating —— with insecticidal substances. (P) Wildt 610
  - Process of photography in colours on ——. (P) Valette and Feret 503
  - Process for printing on ——. (P) Gross 547
  - Process for producing patterns on ——. (P) Freiberger 20*r*
  - Process for waterproofing ——. (P) Oliver and Oliver 20*r*
  - Singeing —— and apparatus therefor. (P) Szilard 641
  - for spherical and dirigible balloons. (P) Porritt, and North British Rubber Co., Ltd. 132
  - Spreading coatings of acetylcellulose on ——. (P) Act.-Ges. f. Anilinfabr. 20
  - Treatment of continuous sheets of plastic ——. (P) Fuller 308
  - Treatment of —— to impart wear-resisting, abrading, and like qualities. (P) Lloyd 785
  - Treatment of textile —— to destroy anthrax or other disease germs. (P) Rhys-Davies 477
  - Treatment of textile and other porous ——. (P) Staunton 1006
  - Treatment of vegetable ——. (P) Hirschberger and Metz 349
  - Treatment of —— with viscous substances, and means therefor. (P) Hart 480
- Factories; Annual report of the Chief Inspector of ——. 1913 894
- Falkland Islands; Penguin guano from the —— 800
- Farnesol in neroli oil. Schimmel 665
- Fastness of dyestuffs; Definition and testing of the ——. Report of "Echtheitskommission" of Verein Deutscher Chemiker 248
- Fat from animal refuse; Extraction of ——. (P) Margoles 431
  - Apparatus for melting ——. (P) Wright 148
  - from bones or other material for glue manufacture; Process for extracting ——. (P) Fischer 1099*r*
  - as a by-product in the manufacture of glue from hide trimmings. Dubovitz 428
  - extractor. Stokes 769
  - from fish and other animal offal, bones, etc,; Means for extracting ——. (P) Haworth 1099
  - in flour and bread; Determination of ——. Neumann and others 1109
  - Hydrogenated edible ——. (P) Ellis 208*r*
  - in milk; Importance of lipoids in the formation of ——. Laxa and Konecny 214
  - for use in the perfume and soap industries. (P) De Baudicour and de la Gabinière 324
  - product; Hydrogenated ——. (P) Ellis 371
  - Rapid determination of —— in cheese, butter, and cream. Kropat 498
  - from the seeds of *Trichilia subcordata*. Oestling 147
- Fats; Analysis of ——. Report of Committee of Amer. Leather Chem. Assoc. 32
  - Bleaching ——:
    - (P) Badische Anilin und Soda Fabrik 363*r*
    - (P) Donnan and others 1018
  - from bones, seeds, etc.; Process and apparatus for extracting ——. (P) Schmidt 428
  - Catalytic hydrogenation of ——. Bontoux 929
  - Changes in the character of —— during the process of cooking. Masters and Smith 937
  - Cooling molten ——. (P) Lemmens 148
  - Detection of mowrah fat in animal and vegetable ——. Berg and Angerhausen 651
  - Detection of nickel in ——. Kerr 362
  - Detection of phytosterol in animal ——. Fritzsche 90
  - Detection of a yellow dye in edible ——. Arnold 90
  - Determination of the acetyl value of ——. Holland 701
  - Determination of cholesterol in ——. Klostermann and Opitz 651
  - Determination of the iodine value of ——. Weiser and Donath 872
  - Determination of rosin in ——. Leiste and Stiepel 1099
  - Determination of unsaponifiable matter in ——. Salomon 428
  - Extraction of —— by means of solvents. (P) Margoles 428
  - Hardening of —— by hydrogenation. Crossley 1140
  - Hydrogenated ——:
    - Leimdörfer 206
    - Sandelin 1097
  - hydrogenated; Industrial production of ——. Verona-Rinati 1061
  - Hydrogenation of ——:
    - (P) Dewar and Liebmann 797
    - (P) Humphreys 797
  - Hydrogenation of —— by aid of nickel oxides and reduced nickel. Ipatiew 797

Fats—*cont.*
Improving the odour and taste of animal and vegetable ——. (P) Gössel 652, 875*r*
Isolation of sterols from —— by means of digitonin. Berg and Angerhausen 1062
Manufacture of catalysts for hydrogenating ——. (P) Ellis 550
Manufacture of food ——. (P) Schmitt 98, 435*r*, 812*r*
Manufacture of sulphonated ——. (P) Russ, and Stolle und Kopke 91, 324*r*, 363*r*
Metallic catalysts for use in hydrogenising ——. (P) Byrom 757
Natural —— from the standpoint of the phase-rule:
Kremann and Klein 928
Kremann and Kropsch 929
Osmium dioxide as catalyst in the hardening of ——. Normann and Schick 756
Preparation of optically active ——. Abderhalden and Eichwald 700
Preparation of a solid or liquid hydrolytic agent for ——. (P) Sudfeldt und Co. 429
Process and apparatus for decomposing ——. (P) Reuter 603*r*
Process for bleaching ——. (P) Baskerville 1162
Process for dehydrating ——. (P) Hering 757
Process for hardening and improving the odour of ——. (P) Herbricht 875
Process for melting animal and vegetable ——. (P) McDonnell 556
Saponification of —— by means of electrolysed saline lyes. (P) Andrault 557
Separation of the vapours of solvents for ——. (P) Bodin, Dupont, and Riom 91
Solidifying —— and converting them into dry powder by means of malt extract or maltodextrin. (P) Hamburg 603*r*
Suitability of hardened —— for human food. Lehmann 763
Treatment of ——:
(P) Gebr. Strobentz Fabriks A.-G., and von Kreybig 973
(P) Testrup, and Lever Bros., Ltd. 1099*r*
Treatment of —— in the manufacture of fatty acids and glycerin. (P) Twitchell 652*r*
Treatment of melted animal and other —— with nascent ozone. (P) Soc. Anon. Electricité et Ozone 798
Unsaponifiable constituents of natural and hydrogenated ——. Marcusson and Meyerheim 491
Fatty saponaceous product from vaseline oil and its manufacture. (P) Benedix 798*r*
substances of linen and hemp; Characters of the ——. Bianchi and Malatesta 602
substances from oil; Manufacture of solid ——. (P) Schlinck 148*r*
Feathers; Process for dyeing ——. (P) Act.-Ges. f. Anilinfabr. 198, 252, 348*r*
Feed-water for boilers; Process and apparatus for distilling ——. (P) Soc. d'Exploit. des Procédés Evaporatoires 186
Heating ——. (P) Kirke, and Bonecourt Surface Combustion, Ltd. 736
Process for purifying boiler ——. (P) Tikhomiroff .. 764
Treatment of —— to prevent incrustation in boilers. (P) Belorussoff 500
Feeding stuffs. Board of Trade Bulletin 1024*r*
Determination of hydrocyanic acid in ——. Furlong 1069
Preparation of new cheap —— from oil-cakes. Nagel 498
Valuation of —— by means of chemical analysis. Smetham 1107, 1108
See also Foods.
Felspar; Commercial method of testing ——. Minneman 78
and a deformation study of some felspar and felspar-quartz mixtures. Watts 78
-kaolin mixtures: Deformation study of ——. Wilson 79
Preparation of potash from —— 1007
Production of potash from ——. (P) Bassett, and Spar Chemical Co. 484
supply of the United States. Watts 1049
Felspars; Use of mixed potash-soda —— in porcelain. Watts 1049
Felt cloth; Process for sizing ——. (P) Shevill 860
Fenchenes; Ozonisation of certain ——. Komppa and Hintikka 437
Fenchocamphorone; Total synthesis of ——, and its oxidation with Caro's acid. Komppa 436
Fenugreek seeds. Wunschendorff 940
Ferment; Process of making a ——. (P) Altenfeld 936
Fermentation; Alcoholic ——. Nottin 880
alcoholic; Formation of lactic acid and glycerol in ——. Oppenheimer 156
alcoholic; Influence of mercury on ——. Nottin 37
alcoholic; Manufacture of metallic vessels for ——. (P) Held 470
alcoholic; Process of ——. (P) De Fazi 936
alcoholic; Significance of water in the processes of ——. Palladin 328
Alteration of the concentration of hydrogen ions during ——. Lüers 272
of amylaceous materials; Process for the ——. (P) Boidin and Effront 213

Fermentation—*cont.*
The amylo-process of ——. Grove 562
of cane sugar syrup; Influence of small amounts of ethyl alcohol on the ——. Cochran and Perkins 272
of dextrose by *B. coli communis* (Escherich); Formation of acetaldehyde in the anærobic ——. Grey 605
The enzyme theory of —— and its limitation. Buchner and Skraup 434
equilibrium and its disturbance by altering the composition of the mixture. Bourquelot and Bridel .. 272
Favourable influence of manganese on acetic ——. Bertrand and Sazerac 842
of hexoses; Formation of aldehyde during ——. Neuberg and Kerb 37
industry; Application of the amyloclastic enzyme of *Aspergillus oryzae* to the ——. Takamine 1068
by living yeast; Rôle of glycogen in ——. Euler.... 328
Molhant process of —— in the cane molasses distillery. Miroir 1166
of polyhydroxycarboxylic acids; Cell-free ——. Von Lebedeff 368
of priming solutions when added to beer; Rate of ——. Baker and Hulton 562
of pyruvic acid by living yeast; Question of the formation of lactic acid by ——. Neuberg and Kerb .. 608
Relation of assimilable nitrogen in beer wort to ——. Schönfeld 658
of saccharine juices to increase the yield of alcohol; Process of ——. (P) Martinand 329
of sludges from residual waters; Process for carrying out ——. (P) Comp. Claricite 331, 610*r*
of some sugars by means of *Aspergillus glaucus*. Tractta-Mosca 935
Thermal phenomena of ——. Metabolism of the yeast cell. Brown 1103
vats; Collections of yeast from ——. (P) Reik 213
Fermentations in the C_3-series. Neuberg and Kerb 561
Fermented beverages; Determination of total solids in ——. Malvezin 272
beverages; Manufacture of ——. (P) Kuhn 659
liquids; Sterilising and purifying ——. (P) Shelmerdine and Lewis 37
Ferments; Action of rosin on ——. Zeiss 1111
Assay of digestive ——. Graber 612
for use in fermentation or distillation processes. (P) Molhant 609*r*
Ferric glycerophosphate; Composition of commercial ——. Umney and Bennett 844
hydroxide; Preparation of colloidal ——. Cohen 135
oxide; Reduction of —— when used as colouring agent for pottery. Kionison 1049
salts; Titration of —— by reduction. Russo 279
sulphate and aluminium sulphate; Mutual solubility of ——. Wirth and Bakke 591
sulphates; The various normal, basic, and acid ——. Wirth and Bakke 591
Ferricyanides; Volumetric determination of —— in presence of ferric iron and cyanides. Müller and Seidel 690
Ferrites; Synthesis of ——. Pukall 863
Ferro-alloys; Electric furnace for producing ——. (P) Soc. Electro-Métallurgique de Saint-Béron 599, 795*r*
from France; Supplies of —— 1057
Ferro-aluminium; Fixation of nitrogen by means of ——. (P) Soc. Générale des Nitrures 483, 549, 961
Ferro-carbonite; Manufacture of ——. (P) Aarts 697
Ferrochromium; Electrometallurgical manufacture of —— from slags. (P) Keller 204
Increasing the yield of chromium in the aluminothermic production of carbon-free —— from chrome-iron ore. (P) Goldschmidt A.-G. 490*r*
Ferrocyanides; Determination of —— by oxidation with alkali bromate. De Koninck and Joassart 669
Production of ——. (P) Coleman 23
Ferromanganese; Electrometallurgical manufacture of —— from slags. (P) Keller 204
Lining for electric furnaces for producing ——. (P) Ges. f. Elektrostahlanlagen, and Rodenhauser 319, 361*r*
Melting ——. (P) Humbert 793
and silicon; Manufacture of an alloy of —— (P) Walker 1013
in steel processes; Use of molten ——. Sahlin 1011
Ferro-nickels; Dilation of —— over a wide temperature interval. Chevenard 1091
Ferrosilicon. Von Schwarz 141
Analysis of ——. Jaubert 1091
and its dangers. Pellew 774
Lining for electric furnaces for producing ——. (P) Ges. f. Elektrostahlanlagen, and Rodenhauser 319, 361*r*
Ferro-tungsten; Method of dephosphorising ——. (P) Becket, and Electro Metallurgical Co. 87
Ferrous chloride and nitric oxide; Supposed crystalline compound of ——. Bellucci 1205
compounds of monoamino acids; Preparation of ——. (P) Hoffmann-La Roche und Co. 42
liquors; Process for utilising waste ——. (P) Oesterle and others 1008
metaphosphate. Colani 351

  Observations on bleaching soda and sulphite pulp ——. Sutermeister ... 857
  for paper manufacture; Compression and density of ——. Beadle and Stevens ... 745
  for paper manufacture; Process of bleaching ——. (P) Lannoye ... 132*r*
  Production of brown shades on ——. (P) Badische Anilin und Soda Fabrik ... 481*r*
  Production of dyestuffs on —— by the one-bath method. (P) Chem. Fabr. Griesheim-Elektron ... 641
  Production of reserve effects on textile ——. (P) Bentz, and Badische Anilin und Soda Fabrik.... 747*r*
  Treatment of —— to increase their coefficient of friction on each other. (P) Muntz ... 546
  Treatment of textile —— with soap baths in the form of froth. (P) Ris ... 477
  Treatment of vegetable ——. (P) Hirschberger and Metz ... 349
  used for ropes and twines; Characteristics and properties of some ——. Kœrner ... 307
  Swelling of textile —— on immersion in water. Justin-Mueller ... 1201
  Tests of the relative strength of ——. Beadle and Stevens ... 307
  from various sources ... 476
  vegetable; Process for preparing ——. (P) Burton, and Burton Co. ... 1203
  vegetable; Production of fast brown or grey prints on ——. (P) Meister, Lucius, und Brüning ... 480
  vegetable; Production of fast shades on —— and dyestuffs therefor. (P) Levinstein, Ltd., and others 73, 197, 251
  The waxes of textile —— and their behaviour in the bleaching process. Higgins ... 902
Fibrin; Influence of certain non-electrolytes on the swelling of ——. Fischer and Sykes ... 932
Fibrous by-products of the animal kingdom; Treatment of solid ——. (P) Henderson, and Henderson Rubber Co. ... 365
  material; Bleaching ——. (P) Luftbleiche Ges. ... 350*r*
  material; Impregnation and coloration of ——. (P) Bache ... 551
  materials; Apparatus for bleaching and scouring ——. (P) Macadam, and Eddystone Manufacturing Co. 959
  materials; Apparatus for drying ——. (P) Stone .. 915
  materials; Bleaching —— by means of ozone. (P) Gminder ... 251
  materials; Process for degreasing raw or manufactured ——. (P) Netz und Co. ... 72
  matter; Process for separating —— from admixtures. (P) Werst and others ... 196*r*
  plants; Apparatus for obtaining fibres, gums, and juices from ——. (P) Raymond and others ... 1006
  refractory material; Manufacture of ——. (P) General Electric Co., and others ... 594, 646*r*
  substances; Medicated ——. (P) Head ... 417
  substances; Process for impregnating ——. (P) Anhydat Leder-Werke A.-G. ... 1006
  substances; Treatment of —— to destroy anthrax or other disease germs. (P) Rhys-Davies ... 477
  waste; Treatment of animal —— for use as a fertiliser. (P) Kirk ... 153
Fields; Chemical, electrochemical, and electrical treatment of ——. (P) Mies ... 432
Fiji; Oil of *Cymbopogon coloratus* Stapf., from —— ... 766
  Vetiver oil from —— ... 805
Filaments from cellulose acetate; Preparation of ——. (P) Mork, and Chemical Products Co. ... 958
  from cellulose ethers; Manufacture of artificial ——. (P) Lilienfeld ... 417*r*
  of cobalt for electric lamps; Manufacture of ——:
    (P) Kanazawa ... 192*r*
    (P) Tanimura ... 69
  from copper-cellulose solution; Manufacture of artificial ——. (P) Verein. Glanzstoff-Fabriken, and Bronnert 72*r*
  for electric incandescence lamps; Manufacture of metallic ——. (P) Sconlar, and Dick, Kerr and Co., Ltd. ... 854, 854*r*
  Manufacture of electric ——. (P) Auer von Welsbach 412
  Preparation of conducting ——. (P) Madden and others ... 741*r*
  Preparation of tungsten wire ——. Ruff ... 1083
  Treatment of incandescence lamp ——. (P) Henderson, and Westinghouse Lamp Co. ... 305

Filaments—*cont.*
  of tungsten or its alloys; Manufacture of ——. (P) Krüger ... 69, 705*r*
  for tungsten lamps; Manufacture of ——. (P) Scholl, and Westinghouse Lamp Co. ... 305
  from viscose; Manufacture of brilliant ——. (P) Verein. Kunstseidefabriken A.-G. ... 132
  from viscose; Production of ——. (P) Steimmig ... 132*r*
Filling material for absorption, reaction, mixing, and cooling towers. (P) Nitrogen Products and Carbide Co., and Nielsen ... 241, 584*r*
  material for reaction or absorption towers. (P) Raschig 907
Films; Apparatus for producing ——. (P) Borzykowski.. 417*r*
  from cellulose acetate; Preparation of ——. (P) Mork, and Chemical Products Co. ... 958
  from cellulose ethers; Manufacture of ——. (P) Lilienfeld ... 417*r*
  from materials dissolved in volatile solutions; Apparatus for producing ——. (P) Borzykowski ... 349*r*
  from nitrocellulose solutions; Production of ——. (P) Berl and Isler ... 746
  from viscose; Manufacture of brilliant ——. (P) Verein. Kunstseidefabriken A.-G. ... 132
Films from viscose; Production of ——:
    (P) Bronnert, and Verein. Glanzstoff-Fabriken 828*r*
    (P) Steimmig ... 132*r*, 688
Filter beds for sewage and other waste liquids. (P) Irwin 1111
  leaf. (P) Burgess, and Butters Patent Vacuum Filter Co. ... 1143
  leaves; Method of cleaning ——. (P) Leach, and Moore Filter Co. ... 822
  Mash ——. (P) Rath ... 563
  particularly for use in brewing. (P) Bearman ... 881
  plate. (P) Porges and Steinschneider ... 409*r*
  -press fabrics. (P) Carman ... 583*r*
  -presses:
    (P) Burger ... 1081
    (P) Chem. Fabr. Griesheim-Elektron ... 188*r*
    (P) Christiansen ... 951
    (P) Merrill ... 541*r*
  -presses; Chamber-plate for ——. (P) Trommer .. 470
  Pressure ——. (P) Sweetland ... 341, 908*r*
  for saccharine juice; Continuously-operating ——. (P) Fleetwood ... 1023
  and settling tank for ore pulp; Combined ——. (P) Reinohl ... 87
  for slimes pulp and the like. (P) Ridgway... 836*r*
  for sludges, especially lignite sludge. (P) Ribbertsche Braunkohlen-, Brikett-, u. Tonwerke ... 14
  for treating ores. (P) Fields ... 1015
Filtering apparatus:
    (P) Genter... 849
    (P) Hölken ... 681
  apparatus; Brewers' ——. (P) Selg ... 1166
  apparatus for laboratory use. (P) Boeck, and Norton Co. 106
  charcoal; Manufacture of active ——. (P) Pilaski 216, 216*r*
  leaf. (P) Shepherd, and Butters Patent Vacuum Filter Co. ... 632
  liquids; Apparatus for ——. (P) Kirschner ... 302
  machines:
    (P) Drage ... 343*r*
    (P) Robinson ... 341
  material of high efficiency; Process for obtaining a ——. (P) Pott ... 187, 342*r*, 343*r*
  material for purifying and softening water; Manufacture of ——. (P) Deutsche Filter Compagnie ... 938
  materials; Manufacture of ——. (P) Von Jaraczewski 906
  media: Process of dislodging slime cakes from ——. (P) Butters ... 13
  ore pulp; Centrifugal device for ——. (P) King and Wilkins ... 360
  slimes; Apparatus for ——. (P) Stedman, and Butters Patent Vacuum Filter Co. ... 781
  slimes in cyanidation. Megraw ... 648
  slimes; Process and apparatus for ——. (P) Butters 781
  solutions; Apparatus for ——. (P) Isherwood 793, 1016*r*
  by suction; Device for freeing a precipitate from mother liquor when ——. Gortner ... 937
  valuable compounds; Apparatus for ——. (P) Burgess, and Butters Patent Vacuum Filter Co. ... 906
  vessel; Sand or gravel —— for purifying waters. (P) Puech, Chabel et Cie... 39
  water; Devices for ——. (P) Shankland ... 1025
  water and other liquids. (P) Dunbar ... 980
  water in reservoirs; Means for ——. (P) Puech, Chabal, et Cie., and Puech ... 610
  water, sewage, etc.; Means for ——. (P) Mitchell.. 99
Filters:
    (P) Alinder, and Allis-Chalmers Manufacturing Co. 187
    (P) Carruthers and Co., Ltd., and others ... 632
    (P) Hughes ... 302
    (P) Kiefer ... 632, 908*r*
    (P) Lamsens ... 583
    (P) Reisert ... 435
  for the cyanide process; Leaf of vacuum ——. (P) Ohtsuka ... 1058
  Mash ——:
    Briant and others ... 212
    (P) Schaefer ... 978
  Mechanical ——. (P) Pulsometer Engineering Co., and Björnstad ... 849

Filters—*cont.*
  for milk, etc. (P) Poupart ... 1024
  Preparation of refractory material with large pores for ——. (P) Kern ... 849
  Pressure ——. (P) Muirhead ... 1192
  Process for dislodging slime cakes from ——. (P) Shepherd, and Butters Patent Vacuum Filter Co... 632
  Rotary drum ——. (P) Bohm ... 187
  Vacuum drum —— for concentrating precious metals, etc. (P) Spence ... 187, 211*r*, 1000*r*
Filtration; Cause of difficult —— in filter-presses during the carbonatation process in the beet sugar factory. Wesely ... 977
  of flue dust, fume, etc., from furnace gases. (P) Rigg, and New Jersey Zinc Co. ... 650
  Studies on ——. Bain and Wigle ... 848
Finely-divided materials; Apparatus for treating ——. (P) Weinrich ... 468
Finishing animal fibres and fabrics; Process for ——. (P) Vidal ... 960
  composition; Preparation of a —— from waste sulphite liquor. (P) Coughlin and others ... 1153
  material from soya beans; Preparation of a ——. (P) Contant and Perrot ... 20, 958
  materials; Manufacture of trimethylamine derivatives for use in making ——. (P) Herzmann ... 838
  materials for textiles, resistant to water; Preparation of ——. (P) Watremez ... 480, 481
  preparation; Cellulose ——. (P) Soc. Industrielle des Téléphones ... 73
Finland; Improvement of marshy land in —— by addition of sand. Rindell ... 432
Fir; Leaf, twig, and bark oils of white ——. Schorger... 1072
Fire extinguishing; Apparatus for scrubbing and cooling gases for ——. (P) Harker, and Harker Fire Extinguisher and Fumigator Co. ... 908
  extinguishing compound. (P) Aylsworth, and Condensite Co. of America ... 309
Firebrick. (P) Hidecker, and Ione Fire Brick Co... 1156
Firebricks; Action of flue dust on ——. Mellor ... 259
  and their testing. Rigg ... 619
Fireclay in coal mines. Mellor ... 1009
  gas retorts, etc.; Manufacture of ——. (P) Evers.. 1085
  Weathering of —— in the manufacture of face brick and paving block. Rainey ... 1048
Firedamp; Device for detecting ——. (P) Accumulatoren-Fabrik ... 846
  Electrical detection of ——. Ralph ... 1082
  whistle. Haber ... 54
Fireproof articles from zirconium dioxide; Production of ——. Ruff and others ... 593
  elastic material and its manufacture. (P) Magelssen.. 259
  electrically conducting bodies; Manufacture of ——. (P) Siemens und Co. ... 146*r*
  material; Manufacture of a ——. (P) Esselborn ... 965
  materials from quartz and the like; Manufacture of ——. (P) Boehm ... 354, 750*r*
Fireproofing composition. (P) Hall, and W. A. Hall Lumber and Fibre Co. ... 82
Fires; Compound for extinguishing ——. (P) Snelling and others ... 908
  in lacquer and gasoline; Extinguishing —— by sawdust 33
Fish: Extraction of oil from ——. (P) Overton ... 91
  guano from India ... 494
  Manufacture of soluble protein compounds from ——. (P) Adler and others ... 763*r*
  manure... 1066
  meal and fish manure ... 1218
  Method and apparatus for cooling and freezing ——. (P) Dahl ... 1219
  offal; Means for treating ——. (P) Haworth ... 1099
  oil from India ... 491
  oil; Process for deodorising the fatty acids from ——. (P) Hofmann ... 324, 492*r*
  Preparation of soluble protein compounds from ——. (P) Naaml. Vennootschap Algem. Exploitatie Maatschappij ... 215
  oil; Production of clear and odourless oils from ——. (P) Bergius ... 702
  Process for preserving ——. (P) Danilevsky ... 371
  -scrap fertiliser industry of the Atlantic coast, U.S.A. Turrentine ... 270
  -scrap fertiliser; Recovery of by-products in the manufacture of ——. (P) McGrath and McGrath ... 366
  as sources of oils; Utilisation of —— ... 797
  Treatment of —— to obtain dried fish and fish guano. (P) Bodin and others ... 661
Flame-extinguishing compound. (P) Aylsworth, and Condensite Co. of America ... 309
  Influence of secondary air on the inner cone of the Bunsen ——. Ubbelohde and Dommer ... 853
  Initiation and propagation of ——. Dixon ... 409
  in mixtures of methane and air; The velocities of ——. Parker and Rhead ... 1000
  reactions. Bancroft and Weiser ... 570
Flames with ether; Cool ——. Leighton ... 1229
  Photographic analysis of gas ——. Dixon and others.. 909

Flames—*cont.*
  Propagation of —— in "limit" mixtures of methane, oxygen, and nitrogen. Burgess and Wheeler 1194
  Propagation of —— in mixtures of methane and air. The "uniform" movement. Wheeler 1195
  Quantity of carbon monoxide and nitric oxide in lighting and heating ——. Terres 825
  Reactions in reversed ——. Meyer and Kerstein 548
  Water-gas equilibrium in hydrocarbon ——. Andrew 303
Flash-point apparatus; Extension of the upper limit of use of the Abel-Pensky ——. Scheel 128
Flavonols; Conversion of benzalcumaronones into ——. Von Auwers and Pohl 827
Flax; Analytical characters of raw and bleached ——. Bianchi and Malatesta 588
  Characters of the fatty substances of ——. Bianchi and Malatesta 602
  Process for preparing ——. (P) Campbell 248*r*
  Process of retting ——. (P) Fernie 132*r*, 478*r*
  Purification, bleaching, and disinfection of —— by means of sulphurous acid. (P) Leconte 958
  straw; Process for retting ——. (P) Fibre Corporation, Ltd. 19
  waste; Conversion of —— into soft, curled, woolly fibres:
    (P) Geisberger 828*r*
    (P) Seidel and Geisberger 746
  The waxes of —— and their behaviour in the bleaching process. Higgins 902
Flotation; Experimental contribution to the study of ——. Schranz 1159
Flour; Apparatus for treating ——. (P) Wesener 803
  containing barium carbonate; Case of poisoning caused by ——. Hugounenq 214
  bleached with chlorine; Some characteristics of ——. Utt 1167
  Decrease of the quantity of gluten in ——. Balland.. 563
  Detection of small amounts of rye flour in wheat ——. Fanto 1109
  Determination of cellulose in —— to ascertain the degree of grading. Lindet 609
  Determination of fat in ——. Neumann and others.... 1109
  Determination of the salt-soluble proteins in wheat ——. Olson 370
  Dry-shortening ——:
    (P) Estabrook, and Larabee Flour Mills Co. 938, 1218
    (P) Estabrook and others 1218
  Dry shortening composition for ——. (P) Estabrook and others........ 803
  or flour stock; Treatment of —— and appliances therefor. (P) Levin 1069
  from malt for baking purposes; Preparation of ——. (P) Hatt frères 882
  Method of improving the condition of ——. (P) Wesener 330*r*
  Milling of ——. (P) Leetham and Sons, Ltd., and Leetham 98
  Natural colouring matters of ——. Bianchi and Malatesta 588
  Oxidising treatment of ——. (P) Levin 435
  Presence of sulphates in ——. Cripps and Wright 1069
  Process for ageing and bleaching ——. (P) Wesener.. 38*r*
  Process of bleaching ——. (P) Wesener 498, 661*r*
  Testing ——. McCormack 609
  Treatment of ——:
    (P) Levin 330, 803, 803
    (P) Samuelson and Backhouse 763
  Treatment of —— with liquids. (P) Samuelson and Backhouse 709
  Treatment of —— and machines therefor. (P) Herendeen 99*r*, 215*r*
Flue-dust; Briquetting —— using as binding agent the dust recovered in purifying blast-furnace gases. Kippe 1094
  dust from furnace gases; Filtration of ——. (P) Rigg, and New Jersey Zinc Co. 650
  gases; Apparatus for determining the percentage of carbon dioxide in ——. (P) Schauli 987
Fluids having different characteristics; Method and means for separating ——. (P) Brown 409
  Electrical treatment of ——. (P) Weston 601
  Heating of ——. (P) McCourt, and Radiant-Heating, Ltd. 69
  Instruments for measuring the flow of —— through a conduit. (P) General Electric Co. 186
  Means for removing particles of suspended matter from ——. (P) Strong and others 1193
  Method of desiccating ——. (P) McLaughlin 409*r*
  Retorts for the heat treatment of ——. (P) Boys.. 540
  Separators for removing impurities from ——. (P) Yardley 736
Fluorides; Action of weak acids on soluble ——. Richards 690
  as opacifiers for glass and enamels. Shaw 1048
Fluorine in the animal economy. Gautier 280
  compounds; Use of —— for the manufacture of submarine paints. (P) Paterno and Manuelli 604
  Determination of —— by Greef's volumetric method. Bellucci 713
  in mineral waters. Gautier and Clausmann 714
  in reagents and its removal therefrom. Carles 376
  in soft waters. Gautier and Clausmann 669

  in the United States 1046
  Valuation of ——. Bidtel 351
Fluosulphonic acid:
    Ruff 350
    Ruff and Braun........ 350
Flux for aluminium and its alloys; Manufacture of ——. (P) Gelly 489, 600*r*
Fodder; Beer yeast as a ——. Dönhoff 562
  Bengal beans, a new ——. Shrewsbury 937
  Use of sweet jower (sorghum) as a ——. Annett.... 1069
Food for animals; Manufacture of ——. (P) Molassine Co., Ltd., and de Whalley 1168
  from cakes made from cottonseed; Manufacture of ——. (P) Molassine Co., Ltd., and de Whalley.. 498
  for cattle; Beetroot leaves as ——. Hitier 273
  for cattle and other animals; Manufacture of ——. (P) Eastick and de Whalley 98, 803
  composition for stock. (P) Little, and Standard Alcohol Co. 563
  fats; Manufacture of ——. (P) Schmitt 98, 435*r*, 842*r*
  for infants, invalids, and old persons; Process for preparing ——. (P) Doming 1024
  preparations or extracts; Manufacture of —— from yeast and blood. (P) Krause 937, 1069*r*
  Process for sterilising —— and freeing it from germs. (P) Ges. f. Sterilisation, and Riegel 98, 883*r*
  Production of predigested ——. (P) Duryea 1024
  products. (P) Douglas 763, 763*r*
  products; Composition for producing lactic ——. (P) Hansen........ 937
  products; Preparation of new cheap —— from oil-cakes. Nagel 498
  products; Preservation of —— by means of sugar. Vasseux 38
  regulations; Canadian pure —— 660
  substances; Method and apparatus for cooling and freezing ——. (P) Dahl 1219
  substances; Process for preserving ——. (P) Allen.. 803
  Use of ossein as a ——. Maurin 937
Foods; Abnormal quantities of tin in canned ——. Rossée and von Morgenstern 1024
  Determination of boric acid in ——. Jay 273
  for infants; Analysis and composition of some proprietary ——. Baker 882
  Manufacture of cattle ——. (P) Eastick and de Whalley 98, 803
  Manufacture of an easily digested —— from whole grain. (P) Mauterer........ 803
  Preparation of a harmless colouring matter for ——. (P) Jacquemin 19
  Preservatives for raw, fresh, or green ——. (P) Rosenbaum 274
  Process for preserving ——. (P) Bocandé 842
  Process for preserving liquid ——. (P) Ges. f. Sterilisation 979
  Process for preventing spoilage of canned ——. (P) Duckwall 1168
  Rapid determination of boric acid normally present in, or added to ——. Bertrand and Agulhon 273
  Treatment of ——. (P) Heller and Brandly 435
  Use of alum in ——. Report of the Remsen Board.... 563
Foot-and-mouth disease; Preparation of curative agents for ——. (P) Ponndorf 220
Forcing liquids; Automatic apparatus for ——. (P) Brown 13
  liquids; Methods and apparatus for ——:
    (P) Humphrey and Rusdell 998
    (P) Joy 341
Forest of Dean. Wood distillation works 1003
Formaldehyde; Action of —— on alcohols in presence of sulphuric acid. Buraczewski and Matejko 707
  Action of —— on wool. Kann 251
  Applications and analysis of ——. Desmurs 502
  and its compounds; Detection of small quantities of —— by means of fuchsin and hydrochloric and sulphurous acids. Fincke 334
  Content of methyl alcohol in the vapours produced in disinfecting rooms with ——. Lockemann and Croner 662
  Formation of —— by oxidising agents. Rosenthaler.. 224
  Manufacture of ——:
    (P) Holzverkohlungs Industrie A.-G. 845*r*
    (P) Von Hochstetter........ 844
    (P) Von Hochstetter, and Perth Amboy Chemical Works 1036
  Manufacture of crystalline polymerisation products of ——. (P) Pollak 218
  and naphthalenesulphonic acids; Manufacture of soluble condensation products of ——. (P) Badische Anilin und Soda Fabrik 269
  Peroxidase- and catalase-reactions of ——. Woker.. 444
  and its polymerides; The vapours of ——. Auerbach and Plüddemann 372
  and sugars; Preparations containing ——. (P) Von Wülfing 218
Formaldehyde-sulphoxylates; Determination of ——. Wild 1046
Formates; Conversion of —— into oxalates by heating. (P) Chem. Fabr. Grünau, Landshoff und Meyer, and others........ 439

(P) Evans, and United Gas Improvement Co... 303
(P) Glasgow 344
Production of ——. (P) Franke 684
Production of combustible gas or vapour from liquid ——. (P) Biddlecombe 740
Production of gaseous ——:
(P) Benjamin 911
(P) Southey 129*r*, 411
Review of recent work on ——. Meneghini 1194
suitable for internal combustion engines; Manufacture of ——. (P) King 853
Treatment of liquid —— for internal-combustion engines. (P) Heyl and Baker 586
Treatment of liquid —— to produce vapour. (P) Porter.. 586*r*
Use of chlorophyll extracts as ——. (P) Bouchaud-Praceiq.. 852
Utilisation of waste —— in gas engines. Coster 1193
wastes; Method of utilising ——. (P) Kitchen 585
Fuels; Method and calorimeter for determining the heating value of ——. (P) Junkers 105
Motor —— with special reference to alcohol. Ormandy 189
Process and apparatus for enriching ——. (P) Manduit 410
Use of tars and heavy oils as —— 193
Fuller's earth; Treatment of —— after use in refining oil. (P) Parsons 1062
Fulminates; Explosive properties of ——. Wöhler and Martin 768
Fulminic acid; New salts of ——. Wöhler and Martin.... 768
Fume concentrator for smelters. (P) Smith 1059
destroying process. (P) Young, and The Thiogen Co. 593*r*
from furnace gases; Filtration of ——. (P) Rigg, and New Jersey Zinc Co. 650
precipitation; Electrostatic —— at Anaconda. Dunn .. 1213
Fumes from coke ovens; Destroying —— during charging and discharging. (P) Collin 636
Extraction of liquids or solids suspended or combined in ——. (P) Armstrong.............................. 186
from smelters; Apparatus for arresting —— and recovering their values. (P) Vadner 321
from smelters; Device for treating ——. (P) Blom.. 795
from smelters; Treatment of and recovery of values from ——. (P) Vadner 870
Fumigating; Apparatus for scrubbing and cooling gases for ——. (P) Harker, and Harker Fire Extinguisher and Fumigator Co. 908
Fungus and its use in saccharifying starch and producing alcohol. (P) Boulard 497, 659*r*
Fur or fur goods; Process for dry-dyeing ——. (P) Lange 252
Preparation of —— for felting. (P) Tweedy, and Matteawan Manufacturing Co. 546
Process of carotting ——:
(P) Donner 957
(P) Paris 640
Process for destroying insects in —— (P) Act.-Ges. f. Anilinfabr. 640*r*
Process for dyeing ——:
(P) Act.-Ges. f. Anilinfabr. 73, 309, 348*r*, 856*r*, 860*r*, 860*r*
(P) Cassella und Co.................................. 641
(P) Goldstein 133
Protection of —— against attacks of moths or other insects. (P) Act.-Ges. f. Anilinfabr 308*r*, 939, 939*r*
Furfural; Process for dyeing wool by means of ——. (P) Lederer and Lederer.............................. 641
Furfuran compounds from hydrolysed lignocelluloses; Recovery of ——. (P) Lederer and Lederer 478
derivatives, especially furfural; Production of black colouring matters from ——. (P) Lederer and Lederer 475
Furnace gases; Apparatus for purifying ——. (P) Eckhardt 13
gases; Cooling —— before filtration. Anderson 925
process; Electric metallurgical ——. (P) Hering.. 926
roofs and walls; Construction and treatment of brickwork ——. (P) Veitscher Magnesitwerke A.-G. .. 241
tubes or chambers for gaseous reactions at high temperatures; Manufacture of ——. (P) Pictet.... 849
working openings through which hot gases are discharged. (P) Rockwell 1014
Furnaces:
(P) Atterbury and Matthews 764
(P) Greenstreet 635, 1000*r*
(P) McCourt 583
(P) McCourt, and Bonecourt Surface Combustion, Ltd. 686
(P) Soc. des Perfectionnements à la Vaporisation 821
(P) Swan and Parker 999
(P) Wilton 14*r*
Annealing ——:
(P) Hillebrand 489
(P) Swindell and Swindell.......................... 1059
Apparatus for charging refuse destructor and other ——. (P) Leask 939

PAGE

Furnaces—*cont.*
- Apparatus for increasing the temperature of combustion in gas-fired ——. (P) Doherty ... 1193
- Apparatus for making receivers for zinc ——. (P) Möhring ... 319
- Apparatus for treating smoke from ——. (P) Thomas, and Smoke Eliminator Synd., Ltd. ... 65*r*
- for assaying; Crude oil for ——. Haldane ... 15
- for baking refractory earths. (P) Valuy ... 408
- Blast —— :
  - (P) Jantet ... 599
  - (P) Reis ... 320
- blast; Economy in the use of the dry blast for ——. Von Ehrenwerth ... 82
- blast; Hoppers for ——. (P) Babcock and Wilcox Co. 1148
- blast; Method of drying air for ——. (P) Johnson .. 598
- blast; Relations between the composition of the throat-gas and the working conditions of ——. Levin and Wesselmann ... 695
- Blast —— for smelting copper-bearing concentrates. Honeyman ... 867
- Blast —— for smelting iron and other ores:
  - (P) Rogerson, and Clyde Furnace Co. ... 755*r*
  - (P) Rogerson ... 835*r*
- blast; Use of dry air in ——. Girvin ... 283
- blast; Use of explosives for removing obstructions in ——. Schönweg ... 27
- blast; Working of ——. (P) Semmler ... 424, 490*r*
- blast; Working coke ovens in conjunction with ——. Freyn ... 584
- for boiling or melting. (P) Tooth ... 950
- for brick dryers; Gas ——. (P) Raymond, Mumma, and Raymond Co. ... 1207
- for burning ore bricks; Channel ——. (P) Ramén .. 361*r*
- Calcining ——. (P) Cornet ... 540, 835
- Casting ——. (P) Hall ... 320
- Coal-dust firing for reverberatory ——. Mathewson .. 1093
- Construction of walls of open-hearth steel ——. (P) Maccallum ... 968
- for continuous concentration, evaporation, and incineration of liquids. (P) Wolesky and Volesky ... 63
- Cupola ——. (P) Schürmann ... 1059*r*
- cupola; Explosions in —— and a safety device for avoiding them. Osswald ... 1054
- cupola; Preventing formation of carbon monoxide in ——. (P) Schürmann ... 361*r*
- Destructor ——. (P) Thomas ... 842
- Electric —— :
  - (P) Bicknell ... 555
  - (P) Brown, and National Carbon Co. ... 555, 796
  - (P) Burke ... 145
  - (P) Chaplet, and La Néo-Metallurgie ... 89
  - (P) Comp. Franç. pour l'Exploit. des Procédés Thomson-Houston ... 928*r*
  - (P) Crafts ... 206*r*, 871*r*, 1162
  - (P) Eyermann ... 145
  - (P) Gray ... 1095
  - (P) Guthrie and others ... 265
  - (P) Helfenstein ... 90*r*, 90*r*
  - (P) Hering ... 926
  - (P) Machalske ... 1161*r*
  - (P) Machalske, and American Ferrolectride Corporation ... 796
  - (P) McNabb ... 796
  - (P) Massip ... 31*r*
  - (P) Méttler ... 146*r*
  - (P) Minet and Lucas ... 837*r*
  - (P) Moffat ... 1017
  - (P) Peacock ... 427
  - (P) Queneau ... 1014
  - (P) Rennerfelt ... 837, 796*r*
  - (P) Schwahn ... 926
  - (P) Snyder ... 491, 796
  - (P) Soc. Electro-Métallurgique de St. Béron 599, 795*r*
  - (P) Stassano ... 89, 871*r*
  - (P) Von Wilmowsky and Pieper ... 555
  - (P) Testrup and others ... 871*r*
  - (P) Wardall and Marchant ... 145
  - (P) Whitmore and Carroll ... 361
- electric arc; Admission of gas into ——. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab ... 872, 872*r*
- electric arc; Apparatus for closing ——. (P) Hole and Olsen ... 89
- electric arc; Electrodes for ——. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab ... 872
- electric arc —— for melting or extracting metal from ore. (P) Krefting ... 650
- Electric arc —— for metallurgy. (P) Rennerfelt ... 599
- electric arc; Protecting the electrodes in —— :
  - (P) Bronn and Schemmann ... 555
  - (P) Bronn and others ... 602*r*
- electric arc; Stabilising means for ——. (P) Guye, and Southern Power Co. ... 971*r*
- electric brass; Melting losses in ——. Gillett and Lohr ... 967
- electric; Cathodes for ——. (P) Sodium Process Co. 602*r*
- electric; Contact for ——. (P) Snyder ... 796
- Electric crucible ——. (P) Calhane ... 491
- electric; Direction given to the gases in —— with arcs spread magnetically. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab ... 601
- electric; Door for ——. (P) Snyder ... 796

PAGE

Furnaces—*cont.*
- electric; Electrode holder for —— :
  - (P) Ges. f. Elektrostahlanlagen ... 491
  - (P) Krupp A.-G. ... 427
- electric; Electrodes for —— :
  - (P) Hering ... 971
  - (P) Hinckley, and National Carbon Co. ... 650
  - (P) Krupp A.-G. ... 31
- Electric —— for fixing nitrogen from the air. (P) Scott ... 1096*r*
- electric, for fixing nitrogen; Electrodes for ——. (P) Scott ... 361
- electric; Incandescence bodies of boron for ——. (P) Podszus ... 474
- Electric induction —— :
  - (P) Benjamin ... 971
  - (P) Helfenstein ... 556*r*
  - (P) Hiorth ... 796
  - (P) Moody, and General Electric Co. ... 1059*r*
- Electric induction —— for refining steel. Frick ... 27
- Electric —— for making ferro-alloys. (P) Soc. Electro-Métallurgique de St.-Béron ... 599
- Electric —— for making stable boron nitride:
  - (P) Comp. Franç. pour l'Exploit. des Procédés Thomson-Houston ... 928*r*
  - (P) General Electric Co. ... 255
- Electric —— for making steel. (P) Levoz ... 600*r*
- Electric —— for the manufacture of aluminium nitride. (P) Coutagne ... 312
- Electric —— for medium temperatures. Schmelz ... 1055
- Electric —— for melting copper and its alloys. (P) Stassano and Petinot ... 554
- electric; Method of heating —— especially for making aluminium nitride. (P) Soc. Générale des Nitrures 427, 555*r*
- Electric —— for metallurgical purposes:
  - (P) Buckman ... 489
  - (P) Stassano ... 490*r*
- Electric —— and method of working them. (P) Bayard ... 1017
- Electric micro- —— for fractionating minerals and alloys. Fletcher ... 104
- electric, for producing ferromanganese, ferrosilicon, and other alloys; Lining for ——. (P) Ges. f. Elektrostahlanlagen, and Rodenhauser ... 319, 361*r*
- Electric —— for producing high temperatures. Tiede and Birnbräuer ... 753
- Electric —— for reducing copper and other ores. (P) Hampton, and Cooley Electric Furnace Co. ... 794
- Electric reduction ——. (P) Frickey, and Noble Electric Steel Co. ... 87
- electric; Reheating of ——. (P) Fischer ... 90, 427*r*
- electric; Rennerfelt —— ... 1210
- Electric resistance ——. (P) Davies, and Gallenkamp and Co., Ltd. ... 1059
- Electric resistance —— and its use for treating zinc ores. (P) Comp. pour le Traitement des Métaux et Minerais par l'Electricité ... 490*r*
- electric; Rotary ——. (P) Bemis, and National Carbon Co. ... 928
- Electric —— with rotary flame for treating gases and vapours. (P) Moscicki ... 755*r*
- Electric shaft ——. (P) Crafts ... 756*r*
- Electric single- or multi-phase —— for treating molten metals. (P) Lescure ... 794, 970*r*
- electric smelting; Cooling the lower electrodes of ——. (P) Krupp A.-G. ... 869
- electric; Starting the arcs of ——. (P) Scott ... 427
- Electric —— for treating lamp filaments. (P) Coolidge, and General Electric Co. ... 651*r*
- Electric vacuum —— for high temperatures:
  - Ruff ... 1016
  - Wolf and Müller ... 145
- Electric zinc ——. Peterson ... 357
- Electric zinc —— with integral condensers. (P) Thomson ... 86, 319, 425, 426
- electrolytic; Cathode for —— :
  - (P) Seward and others ... 555
  - (P) Sodium Process Co. ... 700*r*
- for extracting zinc from its ores in a vacuum. (P) Herter ... 86
- Feeding devices for roasting ——. (P) Stout ... 926
- Fire-grates for gas-producer ——. (P) Gibbons and McEwen ... 1148
- Firing —— with pulverised fuel. (P) Brunner ... 341
- Fuel feeding devices for ——. (P) Greenstreet .. 635, 1000*r*
- Gas ——. (P) Feicks ... 782
- Gas-fired —— :
  - (P) Priest ... 999
  - (P) Tooth ... 240
- Gas-fired cupola ——. (P) Gautier and Esselin ... 88
- Gas-heated ——. (P) King and others ... 926
- gas-; Mixing gas and air for ——. (P) Hoeller ... 128
- Glass ——. (P) Bourdu ... 647
- for heating gases. (P) Olsson ... 954
- for heating ingots; Continuous ——. (P) Siemens 318, 321*r*
- Heating of retort —— for making coal gas, etc. (P) Dessauer Vertikal-Ofen Ges. ... 782
- for the heat-treatment of metals:
  - (P) Grebel ... 970
  - (P) Russell and Lord ... 1014

PAGE

Furnaces—*cont.*
  High-pressure —— for the direct production of iron and steel. (P) Otto 360*r*
  Horizontal mechanical roasting ——. (P) Sarrasin .. 1214
  Liquid-fuel heated tipping —— for melting, smelting, refining, etc. (P) Price 554
  Mechanical roasting ——. (P) Claude 970
  Mechanical roasting —— with helical hearth. (P) Banette 88
  Mechanical —— for roasting zinc blende and other sulphide ores. (P) Kessler 360
  Megass ——. (P) Knight 706
  Melting —— :
    (P) Churchward 836*r*
    (P) Hall 869
    (P) Mellen, and United Aluminium Ingot Co... 554
  Melting —— and apparatus for stirring or agitating molten material therein. (P) Hall 1095
  for melting brass; Tests of natural-gas fired ——. Wolf and Burr.... 966
  for melting glass. (P) Holle 1207
  for melting glass or metals; Tilting ——. (P) Lambot 832, 832*r*
  for melting glass and other fusible substances; Oil-fired —— :
    (P) Higham Manufacturing Co. 486*r*
    (P) Rothkopf 354
  for melting glass, smelting metals, etc.; Liquid-fuel fired ——. (P) Siegwart and Siegwart 342, 963*r*
  for melting metals. (P) Ratcliff and Ratcliff 926
  Melting-pot ——. (P) Coppée 361*r*
  Metal ——. (P) Hall 320, 361*r*, 425, 650*r*
  Metallising ——. (P) Mathewson and Laist 598
  Metallurigical —— :
    (P) Addicks and Brower 144, 836
    (P) Case.... 264
    (P) Greenawalt.... 926
    (P) Hibbard 425
    (P) McCabe 1015
    (P) Smallwood 144*r*
    (P) Wedge 320, 598, 1161
  metallurgical: Electrical heating device for ——. (P) Wedge 360
  Metallurgical and other ——. (P) Williams 359
  metallurgical; Recent progress in the abatement of smoke from ——. Schiffner 1160
  metallurgical; Use of pulverised coal in ——. Lord.. 83
  Muffle ——. (P) Curran 320, 1095*r*
  Muffle —— for producing zinc. (P) Koppers and Lengersdorf 870
  Muffle for reduction ——. (P) Roitzheim 321*r*
  Muffle and similar ——. (P) August's Muffle Furnaces, Ltd., and August 698
  for obtaining easily oxidisable metals. (P) Zavelberg.. 700
  Oil-fired ——. (P) Burdon and Burdon 68
  Open-hearth —— :
    (P) Albert 836*r*
    (P) Siemens 755*r*
  Ore-roasting ——. (P) Bracq 359
  Preventing deposition of carbon in reversing ——. (P) Tschudy 583
  Process for lining —— (P) Eldred 469
  Producer and regenerator ——. (P) Stewart and Bethell 741*r*
  for producing gas and coke; Vertical retort ——. (P) Koppers 68
  for producing metallic powders or coatings. (P) Schoop 321*r*
  Rabble arms for roasting ——. (P) Stout 1058
  Rabble shafts for roasting ——. (P) Fowler 926
  for refining metals. (P) Wills 205
  Refractory lining for ——. (P) Serpek, and Soc. Générale des Nitrures 737*r*
  Refuse destructor and like ——. (P) Scorer, and Meldrums, Ltd. 1170
  Regenerative —— :
    (P) Egler and Blair 14
    (P) Reuleaux and Laughlin 780
    (P) Walsh and Priestley 632
  provided with regenerative chambers. (P) Poetter, and Poetter Ges. 408, 583*r*, 737*r*
  with regenerative firing. (P) Wendt. and Georgs-Marien-Bergwerks- u. Hütten-Verein 737*r*
  Regenerative gas ——. (P) Siemens .. 342, 470*r*, 850, 951*r*
  Regenerative open-hearth ——. (P) Rogerson .. 871*r*, 927*r*
  Regenerative, reversible ——. (P) Knox Pressed and Welded Steel Co.... 554
  Recuperator ——. (P) Stubblebine 1041
  Regulating arc ——. (P) Scott 361
  Reheating ——. (P) Siemens 144, 321*r*, 836*r*
  for reheating, annealing, cementation, or tempering; Semi-continuous —— fired with coal or coke. (P) Conor 970
  Removal of sediments or crusts from rotary and like ——. (P) Ahlmann 906
  Retort ——. (P) Londress and Worley 321*r*
  Reverberatory ——. (P) Soc. Franç. d'Exploit. de Fours Spéciaux à Haute Temperature 320
  Reversible regenerative gas —— of the Siemens type. (P) Reynolds 632
  Reversing regenerative ——. (P) Knox 906
  Roasting —— :
    (P) Beskow and Ramén 871*r*
    (P) Cornet 540, 835
    (P) Fowler, and Pacific Foundry Co. 30
    (P) Laist 1161
  for roasting or drying ores. (P) Ridge 361*r*
  for roasting or drying ores, etc.; Stirrers for mechanical ——. (P) Spinzig and Hommel 31*r*
  for roasting ores;
    (P) De Spirlet 89*r*
    (P) Gibson 1014
    (P) Herzig 1015
    (P) Murphy.... 794
    (P) Piketty 835
    (P) Zavelberg 970, 970*r*
  Roasting —— for ores and the like. (P) Gabrielli.... 554*r*
  for roasting ores; Rabbling appliances for mechanical ——. (P) Harris 1058
  for roasting, reducing, or volatilising metals from ores, etc. (P) Timm 599
  for roasting or smelting ores. (P) Buchholtz, and Oil-Flame Furnace Co., Ltd. 755*r*
  Rotary ——. (P) Churchward.... 31*r*
  with rotating hearths. (P) Beocsini Cementgyári Uoio Részvénytársaság 27*r*
  Salt-bath ——. (P) Brayshaw and Brayshaw 1161
  Screw or worm conveyors for charging rotary reduction ——. (P) Bourcoud 489
  Smelting —— :
    (P) Riveroll 1014
    (P) Williams and Holdsworth 1014
  for steel making; Crucible *versus* electric ——. Nesbitt 595
  Stirring device for mechanical roasting ——. (P) Metallbank und Metallurgische Ges. 794
  sulphate; Scrapers for agitators in ——. (P) Meister, Lucius, und Brüning 23, 485*r*
  for treating ores, etc. :
    (P) Beskow and Ramén 426*r*
    (P) Frey 88
  Tunnel —— for tempering, cementation, etc. (P) Richter.... 206*r*
Fusarium; The colouring matters of ——. Bezssonoff .. 913
Fuse compositions containing phosphorus: Manufacture of ——. (P) Deutsche Waffen- u. Munitionsfabriken 769
Fusee; Time-burning railway signal ——. (P) Ross, and Central Railway Signal Co. 614
Fusel oil; Production of ——. (P) Scheckenbach....329, 497*r*
Fushun, China; Ammonium sulphate plant at —— 749
Fusible substances; Apparatus for melting and projecting ——. (P) Morf 737*r*
Fusion of highly refractory materials. (P) Podszus .. 700, 837*r*
  Process and apparatus for electric ——. (P) Grabowsky 869

G

Galactite and α-ethylgalactoside; Identity of ——. Fischer 332
Galalith; Manufacture of ——. Bonwitt 876
Galangal oil; Constituents of ——. Fromm and Fluck .. 711
Galbanum oil. Semmler and Jonas 765
Galega officinalis; An alkaloid from ——. Tanret 611
Galegine; Constitution of ——. Tanret 664
Galicia; Production of petroleum spirit from natural gas in ——. Rozanski 15
Gallic acid; Derivatives of ——. Schwenk 759
  Preparation of ——. (P) Nitritfabrik, and Hamel .. 844
Gallocarboxylic acid; Manufacture of the bismuth salt of ——. (P) Bayer und Co. 277, 614*r*, 767*r*, 890
Gallocyanines. *See under* Oxazine dyestuffs.
Galloflavin :
    Herzig 413
    Herzig and Wachsler 131
Galls; Constitution of tannin from Turkish and Chinese ——. Feist and Haun 94
Galvanising metal sheets; Process and means for ——. (P) Folland, Morris, and Griffiths 205
  wire, hoops, sheets, etc. (P) Field and others 425, 600*r*
  wire, sheets, etc.; Bath for ——. (P) Turnbull 489
Gambier; Chinese block ——. Sommerhoff and Apostolo 839
Garbage; Manufacture of alcohol from ——. (P) Morgan 1170
  Method for disposing of ——. (P) Woollacott and Saxton 804
  Process for utilising ——. (P) Kitchen 804
  Treatment of ——. (P) Matlack, and Sewage and Garbage Power Co.... 884
Gas, air-; Manufacture of ——. (P) Pace 910
  and air; Method and means for mixing —— for gas furnaces. (P) Hoeller 128

PAGE

Gas—*cont.*
- analysis apparatus:
  - (P) Billings and Little 615
  - (P) Taplay and Abady 714
- analysis apparatus for treating gases with measured quantities of a liquid reagent. (P) Heinemann .. 809
- Analysis of coal- —— with the Bunte burette. Czakó 242
- analyses by fractional distillation at low temperatures. Burrell and Seibert 808
- Apparatus for the catalytic combustion of ——. (P) Schmidt and Krieger 635
- Apparatus for determination of benzene in illuminating ——. (P) Soc. Roubaisienne d'Eclairage par le Gaz et l'Electricité 129
- Apparatus for generating ——:
  - (P) Barnum and others 471
  - (P) Degenhardt 472, 1083*r*
  - (P) Shaw, and Shaw Kiln Co. 782
- Apparatus for manufacturing ——:
  - (P) Cochran, and National Gas Process Co. 636
  - (P) Jones and Jones 411
  - (P) Nelsen 16
- Apparatus for manufacturing coal- ——:
  - (P) Congdon 471, 782, 954*r*
  - (P) Ritter-Conley Manufacturing Co. 911*r*
- Apparatus for producing combustible ——. (P) Strache 910
- Apparatus for purifying ——. (P) Smith 824
- Apparatus for subjecting —— to the action of fluids. (P) Wagner, and Bartlett Hayward Co. 468
- Apparatus for washing and cooling ——. (P) Lloyd 68
- Apparatus for washing and recovering ammonia from ——. (P) Lymn 245*r*
- Apparatus for washing or scrubbing ——. (P) Williams 411
- from bituminous fuel; Process for producing ——. (P) Berry 1197
- blast-furnace; Cleaning and utilisation of ——. Johnson 1144
- blast-furnace-; Development of dry-cleaning in the purification of ——. Müller 553
- Blast-furnace —— enriched with coke-oven gas. Bone 634
- blast-furnace-; Purification of ——. (P) Schwarz ... 411
- blast furnace-; Purifying —— by water spraying and cooling. Bayer 1094
- blast-furnace; Use of dust recovered in purifying —— as binding agent in briquetting ores and flue dust. Kippe 1094
- calorimeters. (P) Simmance and Abady 45
- cleaner. (P) Ernst 16
- -cleaning mechanism. (P) Egler, and Blair Engineering Co. 129
- from coal by distillation *in vacuo*; Composition of the ——. Burgess and Wheeler 191
- Coal- and petrol- —— for lighting. A comparison. Scott-Snell 686
- coke-oven-; Long-distance transmission of ——. Witzeck 1144
- Device for indicating naphthalene in illuminating ——. (P) Deville, and Soc. du Gaz de Paris 824
- The difference between the calculated and determined calorific values of coal ——. Weyman 11
- "Double" —— for small works. Tully 909
- Electrical removal of tar from ——:
  - Steere 1145
  - White and others 1000
- engines; Power production from ——. Coster 1193
- Extraction of ammonia and sulphur compounds from ——. (P) Cobb 954*r*
- Extraction and recovery of certain substances from coal ——. (P) Hultman 191*r*
- Firing of —— by adiabatic compression. Dixon and others 909
- free from carbon monoxide; Production of coal- ——. Jochum 242
- generators:
  - (P) Akerlund, and Standard Gas Power Co. 1148
  - (P) Barnum 824
  - (P) Ensign 16

manufacture; Reactions involved in plate ——. Gelstharp 77
Manufacture of white ——. (P) Verein. Chem. Fabr. Landau, Kreidl, Heller und Co. 137*r*
manufacturer; Needs of the —— in the way of refractories. Berry 1047
melting furnace. (P) Holle 1207
melting furnaces; Process for heating —— by liquid fuel. (P) Siegwart and Siegwart 342, 963*r*
and metal; Production of gas-tight seals or closures between ——. (P) Sand and Reynolds 571
Method and mixture for making illuminating ——. (P) Macbeth, and Macbeth-Evans Glass Co. 693, 832*r*
Oil-fired furnaces for melting ——. (P) Rothkopf .. 354
Ovens for the manufacture of sheet ——. (P) Montan- u. Industrialwerke vorm. J. D. Starck 693
plates; Manufacture of ——. (P) Bicheroux, Lambotte and Co. 750, 750*r*
Presence of traces of zinc in ——. Javillier 164
Resistivity of —— at high temperatures. Campbell 866
rods; Apparatus for manufacturing ——. (P) General Electric Co. 831

PAGE

Glass—*cont.*
Selenium as colouring agent in soda-lime silicate ——. Fenaroli 201
Similarity between solutions of gold in water and in ——. Silverman 1047
for spectacles; Preparation of eye-preserving ——. Crookes 646
Surface devitrification of —— under thermal after-treatment. Brockbank 77
Tellurium as a colouring agent in soda-lime silicate ——. Fenaroli 790
Tilting furnaces for melting ——. (P) Lambot .. 832, 832*r*
tubes, etc.; Process for shaping, graduating, or calibrating ——. (P) Küppers 921

Glasses; Selenium ——. Witt and Fränkel 790
Thermometer ——. National Physical Laboratory Report 893

Glaze; Apparatus for sifting and separating potters' ——. (P) Beardmore and others 694
colours; Nickel in ——. Wicks and Mellor 258
Effect of variation of RO elements upon chromium oxide as a colouring agent in a matt ——. Minton 1050
Influence of soluble salts in clay upon behaviour of ——. Coats 1050
A type of crystalline —— at cone 3. Rand and Schurecht 1050

Glazes; Behaviour of some —— in the glost oven. Damp and dry spots. Mellor 258
Some cobalt-uranium colours for pottery ——. Radcliffe 1050
Coloured porcelain —— at cone 10. Montgomery and Kruson 1051
Deformation temperatures of some porcelain ——. Stull and Howat 1050
on earthenware bodies; Crazing of lead ——. Callcott 258
Enamel —— free from lead and tin. Berge 647
Lead —— and leadless glazes. Government Laboratory Report 892
Leadless —— in commerce. Petrik 314
Matt ——. Pence 80
for pottery; Production of white and coloured ——. (P) Völkel 137, 486*r*
The problem of lead in ——. Dorfner 693
Roofing tile ——. Montgomery and Tefft 1050
for stoneware and fine earthenware; Fritted ——, especially leadless glazes. Berge 257
Terracotta ——. Phillips 1050

Gloss oil in linseed oil; Determination of ——. Thurston 556

Glucal, a reduction product of dextrose. Fischer 211

Glucinum sulphate and its hydrates. Taboury 1087

d-Glucosamine; Conversion of —— into *d*-mannose. Irvine and Hynd 433

Glucose; Absorption of —— by bone-black. Morton 1022
Action of dextrin —— on tannin-glucosides. Sommerhoff 152
Determination of traces of iron in starch ——. Eastick and others 154
in leather; Determination of ——. Amer. Leather Chemists' Assoc. 209
from sawdust or other cellulosic material; Production of ——. (P) De Posnansky 497, 978
from wood or other cellulose material; Manufacture of ——. (P) Classen 761*r*

Glucoses; Partially methylated ——. Irvine and Hogg .. 657

α-Glucosidase; Specific nature of ——. Aubry 880

Glucosidases; Specific action of —— with regard to their synthetic properties. Bourquelot 706

Glucosides; Action of —— on germination. Sigmund .. 1118
of glycerol and glycol; Synthesis of α- ——. Bourquelot and Bridel 40
of mustard oil. Schneider and Wrede 940
of the purine bases; Synthetic ——. Fischer and Helferich 217

Glucoxylose; A natural benzoyl derivative of a new ——. Power and Salway 566

Glue from hide fleshings preserved with formaldehyde. Verein Deutscher Lederleimfabriken 1021
from hide trimmings; Fat as a by-product in the manufacture of ——. Dubovitz 428
from hides; Manufacture of ——. Cambon 974
Manufacture of ——:
(P) Contant and Perrot 877
(P) Löw and Fischer 327
manufacture; Extraction of fat from materials suitable for ——. (P) Fischer 1099*r*
Manufacture of vegetable ——:
(P) Lehmann and Stocker 366*r*
(P) Perkins Glue Co. 559
(P) Perkins Glue Co., and Heide 1164*r*
Preparation of casein ——. (P) Bernstein and Bernstein 432
Specifications and tests of ——. Linder and Frost .. 1021

Gluten in flour; Decrease of the quantity of ——. Balland 563
Variations of ——. Marchadier and Goujon 979

dl-Glyceric aldehyde; Isolation of crystalline —— from a syrup obtained by oxidising glycerol. Witzemann 1114

PAGE
Glycerides of coconut oil. Bömer 756
  and their fatty acids ; Applications of method of determining the difference in melting points of ——. Bömer 38, 323
  of unsaturated fatty acids ; Conversion of —— into saturated compounds :
    (P) Bedford and Williams 324
    (P) Bedford and others 429r
  of unsaturated fatty acids ; Process for reducing ——. (P) Fuchs 652r
Glycerin ; Apparatus for distilling —— :
    (P) Wood 1215r
    (P) Wood, and Marx and Rawolle 798
  Determination of glycerol in commercial ——. Tortelli and Ceccherelli 207
  from distillery vinasses ; Extraction of the ——. (P) Guignard and Watrigant 497r
  and fatty acids ; Manufacture of ——. (P) Twitchell 148r
  from oils and fats ; Manufacture of ——. (P) Twitchell 652r
  Process for decolourising ——. (P) Badische Anilin und Soda Fabrik 363r
  Process for distilling ——. (P) Wood, and Marx and Rawolle 363
  Synthetic manufacture of ——. (P) Heinemann 767r
  trade in Marseilles 875
  in the United States 930
Glycerinosols of gold. Von Weimarn 1229
Glycerol in alcoholic fermentation ; Formation of ——. Oppenheimer 156
  in commercial glycerin and soap lyes ; Determination of ——. Tortelli and Ceccherelli 207
  Dehydration of —— by a ferment occurring in water. Voisenet 369
  Esterification of —— by acetic acid in presence of catalysts. Senderens and Aboulenc 1114
  Isolation of crystalline *dl*-glyceric aldehyde from a syrup obtained by oxidising ——. Witzemann 1114
  and oxalic acid ; Interaction of ——. Chattaway .. 218
Glycerol α-glucoside ; Biochemical synthesis of ——. Bourquelot and Bridel 40
Glycerol halogen-hydrins ; Direct process for producing ——. (P) Zollinger 219
  Preparation of —— together with polyhydroxy-fatty acid esters. (P) Grün 667
Glycerol-resin ; Vulcanised ——. (P) Arsem, and General Electric Co. 94r
Glycerophosphates of commerce ; Composition of the ——. Umney and Bennett 844
Glycerophosphoric acid and maltose ; Production of a stable crystalline compound of ——. (P) Jacoby 43
Glycerylphosphates ; Synthesis of α- and β- ——. King and Pyman 665
Glycocoll ; Metallic compounds of ——. Bernardi 1073
  Reactions of ——. Chelle 1074
Glycogen ; Factors influencing the end-point of the hydrolysis of —— by diastatic enzymes. Norris 1023
  Rôle of —— in fermentation by living yeast. Euler 328
  in yeast ; Determination of —— :
    Salkowski 841
    Schönfeld and Künzel 155
Glycol α-glucoside ; Biochemical synthesis of ——. Bourquelot and Bridel 40
Glycollic acid and its application in dyeing and printing. Diehl 417
Glycollic acid esters of 2-phenylquinoline-4-carboxylic acid. (P) Chem. Fabr. vorm. Schering 334r
Glycols ; Preparation of —— from dibromides. Bainbridge 1027
1.3-Glycols ; Preparation of ——. (P) Earle and others .. 567
β-Gnoscopine ; Synthesis of ——. Hope and Robinson .. 939
Golawai gum from Northern Nigeria 495
Gold ; Annealing of ——. Rose 1157
  and arsenic ; Alloys of ——. Schleicher 357
  Assay of —— by iron-nail method. Hall and Drury 29
  from auriferous copper ; Electrolytic recovery of —— at Lithgow, N.S.W. Blakemore 202
  Auto-reduction as a factor in the precipitation of metallic ——. Lenher 792
  Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  in ceramics ; Use of ——. Granger 693
  -coated wire, plates, etc. ; Manufacture of ——. (P) Max and Kammerer 598
  in crude platinum ; Determination of ——. Schwitter 751
  Cyanide precipitate ; Treatment of ——. Megraw .. 423
  cyaniding ; Use of lime in ——. Merton 202
  Determination of —— in by-products containing platinum, iridium, etc. Jolly 1091
  Dilute solutions of aluminium in ——. Heycock and Neville 867
  Extraction of —— from auriferous mispickel and other arsenical ores. (P) Grandjean 88
  Extraction of —— from complex sulphide ores. (P) Fiévet 321
  Extraction of —— from ores :
    (P) Caldwell 1057
    (P) Howson 598
  Loss of — in cupellation. Loevy 141
Gold—*cont.*
  Method of assaying concentrates and battery chips for ——. Crosse 487
  -nickel-copper alloys ; Ternary ——. De Cesaris 261
  ore ; Roasting sulpho-telluride —— at the Kalgurli Gold Mines. Brinsden 202
  ores containing deleterious slimes ; Treatment of ——. (P) Darrow 794
  ores of East Gippsland, Victoria ; Treatment of the complex ——. Mickle 202
  ores ; Experiments in cyaniding ——. Cohen 29
  ores ; Treatment of ——. (P) Kitsee 143
  ores ; Treatment of complex, refractory ——. (P) Titus, and Montana Metallurgical Co. 1057
  Precipitation of —— from cyanide solutions. Megraw 751
  Precipitation of —— from cyanide solutions by carbon. Cowles 202
  Precipitation and separation of —— from solutions. (P) Towne and Robinson 320
  Precipitation of —— by zinc dust. Merton 263
  proof plate ; Preparation of a fine —— by chlorine gas. Melbourne Mint Assayers 1157
  Recovery of —— from refractory ores. (P) Butters 836r
  Recovery of —— from sea-water and other very dilute solutions. (P) Baur and Nagel 88, 555r
  Resistivity of pure —— in the temperature range 20° to 1500° C. Northrup 357
  from sand ; Process for recovering ——. (P) Hamilton 870
  -silver-copper-nickel alloys ; Quaternary ——. Parravano 1092
  surfaces ; Electrical condition of —— during the absorption of gases and their catalytic combustion. Hartley 443
  -vanadium alloys. (P) Von Oefele and Schweitzer.... 969
  -zinc slime ; Treatment of ——. White 1091
Gold ; Glycerinosols of ——. Von Weimarn 1229
  -hydrocyanic acids ; Manufacture of double salts of ——. (P) Meister, Lucius, und Brüning 767, 1172r
  salts with organic bases ; Manufacture of double compounds of ——. (P) Meister, Lucius, und Brüning 1036
  Similarity between solutions of —— in water and in glass. Silverman 1047
  solutions ; Immediate coagulation of colloidal —— by gold, silver, or aluminium foil. Von Weimarn .. 1229
  solutions ; Preparation of colloidal ——. Halle and Pribram 597
  solutions ; Reactions in the preparation of colloidal —— by the formaldehyde method. Influence of carbonic acid on the formation of these solutions. Von Naumoff 868
Gold Coast ; *Hevea* rubber from the —— 1063
Goose fat ; Detection of lard in ——. Bömer 323
Gossypium herbaceum (cotton-root bark) ; Chemical examination of ——. Power and Browning 1026
Government Laboratory ; Report of the Principal Chemist of the ——. Year ended March 31, 1914 892
Grading coal, coke, etc. ; Method and means for ——. (P) Benson, and Head, Wrightson, and Co., Ltd. 67
  finely-divided materials ; Method and apparatus for ——. (P) Hitchcock 737r
  powdered material ; Apparatus for ——. (P) Comp. de Fives-Lille, and others 409
Graduating tubes of glass, etc. ; Process for ——. (P) Küppers 921
Grain ; Apparatus for drying ——. (P) Soc. de Constructions Mécaniques d'Alais 631
  cleaning appliances ; Treatment of residue from ——. (P) Robinson and Son, and others 709
  Determination of crude fibre in ——. Stiegler 708
  dusts ; Explosibility of ——. Brown 1167
  Machine for malting ——. (P) Sleeman 1166
  Manufacture of an easily digestible food from whole ——. (P) Mauterer 803
  Milling of ——. (P) Klopfer 274
  products ; Treatment of ——. (P) Levin 330
  Purification of ——. (P) Reynolds 371
  residues ; Treatment of —— after extraction of the oil by solvents. (P) Harburger Eisen u. Bronzewerke A.-G., and Koeber 602, 603r
  Treatment of ——. (P) Samuelson and Backhouse 760, 882
  Treatment of —— in the distillery by means of enzymes, to recover oil. Vasseux 707
  Treatment of —— in the production of malt. (P) Chichester 37r
  Treatment of seed ——. (P) Fry and De Wolf 938, 1067, 1101, 1217
  Treatment of washed or damped ——. (P) Jaquet .. 274
Grains ; Oxidation treatment of ——. (P) Levin 435
  Treatment of ——. (P) Pointe 330
Granular materials ; Apparatus for treating ——. (P) Weinrich 468
  materials ; Process for agglomerating ——. (P) Kroll 302r
  materials ; Process of drying or cooling ——. (P) Bornemann, and Topf und Söhne 823r
  substances ; Apparatus for heating, cooling, and drying ——. (P) Samuelson and Backhouse 13
  substances ; Process and apparatus for drying ——. (P) Topf und Söhne 188r

Grape juice ; Manufacture of unfermented —— in California. Cruess and Hintze 496
  mares ; Treatment of —— to extract various products. (P) Disdier 608
  mares from wine manufacture ; Dry distillation of ——. (P) Daza 192
  must ; Nitrogenous matter of ——. Marcille 562
Grapes ; Crystallisation of cream of tartar in the fruit of ——. Alwood 496
  Test of commercial fertilisers for ——. Hedrick and Gladwin 933
Graphite ; Chemical process for purifying natural ——. (P) Lainé 550, 750r
  conductor. (P) Arsem, and General Electric Co..... 474r
  Heat resistivity of ——. Richards 352
  Hydrogen sulphide from artificial ——. Woodcock and Blount 255
  Lubrication with colloidal —— and with oils. Mabery 1079
  Process and apparatus for enriching ——. (P) Mauduit 410
  Process for purifying ——. (P) Humann and Teisler 256r
  from worn-out crucibles ; Method of recovering ——. (P) Teichmann 24r
Graphitising carbon ; Apparatus for ——. (P) Héroult, and Electrode Co. of America 200
Grease ; Continuous extraction of —— and apparatus therefor. (P) Gohy 546
  from effluents ; Recovery of ——. (P) Chambers, Hammond, and Jarmain 331
  Lubricating —— which may be used to prevent and remove boiler incrustations. (P) Oliveras 148
  Manufacture of a consistent lubricating ——. (P) Chem. Fabr. Troisdorf Dr. Hülsberg und Seiler 90, 603r
  Manufacture of wagon- or machine- ——. (P) Schmitt 838
  Presses for extracting ——. (P) Mays and others .. 1215
Greases ; Machines for testing the lubricating properties of ——. (P) Hislop 90
Great Britain ; Manufacture of aniline dyes in ——. Moulton 1199
  Prohibition of certain exports from ——. 810, 846, 896, 988, 1038, 1118, 1230
  Supply of chemical products to —— and her dependencies. Tilden 1134
  See also United Kingdom.
Grecian port wine. Kickton and Murdfield 658
Green dyeings ; Process for producing ——. (P) Meister, Lucius, und Brüning 480
Grey ; Fast steam ——. Justin-Mueller. Report by Favre 689
  prints on vegetable fibre ; Production of fast ——. (P) Meister, Lucius, und Brüning 480, 642
Grignard's reagent ; Action of —— on alkoxy groups ; Simonis and Remmert 218
  Action of chromic chloride on ——. Bennett and Turner 567
  Oxidation of ——. Ferrario 888
Grinding apparatus ; Method of applying abrasives to ——. (P) Hitchcock 781
  calcium carbide ; Process for ——. (P) Landis, and American Cyanamid Co........ 788
  Compound mill for wet- ——. (P) Polysius Eisengiesserei u. Maschinenfabrik 907
  machine. (P) Jackson 132r
  mills :
    (P) Allen and Co., Ltd., and others 126
    (P) Kniskern 907
  mills for ores, etc. (P) King, and Head, Wrightson, and Co., Ltd........ 319
  mills ; Roller and ring ——. (P) Gebr. Pfeiffer 241, 408
Ground-nuts ; Trade and crushing of —— in Marseilles.... 875
Gru-gru nuts and kernels from the West Indies 147
  oil. Knapp 9
Guanidine salts ; Preparation of ——. (P) Bayer und Co. 220
Guano ; Penguin —— from the Falkland Islands 800
Guara, a new tanning material. Eitner 1064
Guayule plant ; The rubber and resin content of the —— in relation to rainfall: Lloyd 107
Guinea corn ; Occurrence of hydrocyanic acid in ——. Furlong 1069
Gum arabic ; Detection of —— in presence of dextrin. Armani and Barboni 433
  benzoin ; Analytical characters of ——. Cocking and Kettle 843
  in cane molasses ; Determination of the ——. Steuerwald and van der Linden 977
  from locust-beans ; Manufacture of ——. (P) Pinel 879r
  Manufacture of ——. (P) Greenwood and White 879r
  resins ; Treatment of —— and apparatus therefor. (P) Raymond 208, 931r
Gums ; Extraction of —— from vegetable tissues containing them. (P) Kempter 93, 431r
  from fibrous plants ; Apparatus for obtaining ——. (P) Raymond and others 1006
  from Northern Nigeria ; Golawai, katalabu, and kolkol —— 495
  Reversible transformation of —— from the emulsoid into the suspensoid condition. Scarpa 561
Gun barrels ; Steel alloys for use in making ——. (P) Pasel 697
Guncotton ; Determination of nitrogen in —— by means of the nitrometer. Beckett 628
  Heat test of ——. Egerton 113
  manufacture. (P) Guiguet 376
Gun-metal ; Mechanical properties of ——. Influence of temperature. Longbottom and Campion 867
Gunpowder ; Manufacture of ——. (P) McDowell 161
  Manufacture of progressive ——. (P) Eberlein 769r
β-Gurjunene ; The sesquiterpene ——. Semmler and Spornitz 436
Gurjunenes in East Indian copaiba oil ; Separation and properties of the ——. Semmler and Jakubowitz 566
Guttapercha ; Manufacture of ——. (P) Nederlandsche Gutta-Percha Maatschappij 431
  Production of pure —— from the crude product. (P) De Bandicour and de la Gabinière 326r
  resin ; Vulcanisation of ——. Ditmar 709
  Treatment of ——. (P) Feval and de la Fresnaye .. 839r
Guyot tar. Petkow 1074
Gypsum ; Calcining of ——. Snider 81
  Dehydration of ——. Gaudefroy 791, 921
  Gas kiln for burning ——. (P) Stein et Cie......... 551
  Superficial metallisation of ——. (P) Marino 650r

H

Hadfield Research Prize. Iron and Steel Institute 998
Haematoxylin ; Process for weighting silk with ——. (P) Müller 418, 590r
Hair ; Apparatus for dyeing, sterilising, washing, and drying ——. (P) Crowther 547
  Process for carotting ——. (P) Paris 640
  Process of converting ——. (P) Campbell, and American Glue Co. 975
  Process for dyeing —— :
    (P) Act.-Ges. f. Anilinfabr. 73, 198r, 252, 309, 348r, 856r, 860r, 860r
    (P) Monnet 309
Half-wool and half-silk dyestuffs ; Manufacture of ——. (P) Meister, Lucius, und Brüning 194
Halide salts ; Use of telluric acid for the determination of bromine associated with chlorine in ——. Gooch and Cole 352
Halides ; Electrolysis of alkali —— and apparatus therefor. (P) Siemens und Halske A.-G........ 23
Halogenated CC-dialkylbarbituric acids ; Preparation of ——. (P) Einhorn 667
Halogenated 2.3-naphthisatins. (P) Bayer und Co....... 131r
Halogen-hydrins ; Synthesis of optically active ——. Abderhalden and Eichwald 700
Halogen-hydrocarbons ; Acetylation of ——. (P) Masland, and du Pont de Nemours Powder Co. 844, 844
  from carbon ; Production of ——. (P) Tischenko and Plauson 412
  Production of —— from peat. (P) Tischenko and Plauson 244
6-Halogen-1-methyl-3-hydroxybenzene-4-carboxylic acids ; Preparation of ——. (P) Riedel 984
Halogens in benzoic acid ; Simple test for ——. Wende .. 276
  Determination of —— simultaneously with carbon. Thies 223
  in organic compounds ; Determination of ——. Busch and Stöve 1076
Hanks ; Apparatus for bleaching, dyeing, or washing ——. (P) Courtaulds, Ltd., and Clayton .. 197, 828r, 1153r
  of yarn ; Apparatus for shifting —— in dyeing. (P) Hahn and others 641
Hardness ; Interstrain theory of ——. McCance 1159
  of metals or other materials ; Means for ascertaining the ——. (P) Heathcote, and Rudge-Whitworth, Ltd. 425
  tests. Relation between Brinell ball-test and scleroscope readings. Thomas 1213
Hardwood distillation in the United States. Palmer 345
  distillation on the United States Pacific Coast : Possibilities of ——. Palmer 1044
Harmine and harmaline. Fischer 216
Harness leather ; Growth of mould on ——. Seymour-Jones 493
Hat bodies ; Apparatus for dyeing ——. (P) Robinson and Robinson 1153
Hawaii ; Utilisation of pine-apple by-products in —— 157
Hawaiian soils ; Organic nitrogen of ——. Kelley and Thompson 270
Heat of caked coke ; Utilisation of the waste ——. (P) Semmler 411, 473r
  of coke produced in vertical gas retorts ; Utilisation of the residual ——. (P) Toogood, and Dempster and Sons, Ltd........ 740r
  consumed by regenerative coke ovens ; Exact determination of the quantity of ——. Lecocq and Pieters 188

liquid for oil-baths; Means for ——. (P) Higgins 912
liquids; Method of ——. (P) Zwingenberger, and Roessler and Hasslacher Chemical Co. 850
material containing liquid; Process and apparatus for ——. (P) Franke 245, 245, 245*r*, 245*r*
peat and other peaty substances; Process and apparatus for —— to prepare them for mechanical dehydration. (P) Wolters 825*r*
retort furnaces for the manufacture of coal-gas, etc. (P) Dessauer Vertikal-Ofen Ges. 782
rotary tubular kilns; Method of ——. (P) Engelhardt 637
sand, stone, grit, and like materials; Method and means for ——. (P) Coleman and Coleman 468, 1192
substances by the heat generated in forming metallic sulphides; Process for ——. (P) Lang 346
substances uniformly in an electric arc; Process and furnace for ——. (P) Von Wilmowsky and Pieper 555
value of fuels; Method and device for measuring the ——. (P) Junkers 1 0
vegetable and mineral matter; Kiln for ——. (P) Waterhouse and van Mater 950

Hedge clippings and trimmings; Ashes of —— as a source of potash. Russell 1216

Hedychium paper; Effects of mineral loading on the physical qualities of ——. Beadle and Stevens 308
pulp; Influence of addition of —— to chemical and mechanical wood pulps, on the physical qualities of the paper produced. Beadle and Stevens 688

Helichrysum saxatile (Moris.); Oil of ——. Francesconi and Sernagiotto 1222

Helium; Production of —— by the electrical discharge. Collie and others 1087

Hemp; Analytical characters of raw and bleached ——. Bianchi and Malatesta 588
Characters of the fatty substances of ——. Bianchi and Malatesta 602
Natural colouring matters of ——. Bianchi and Malatesta 588

1.5-Heptanedione from caoutchouc. Harries 364

Herring oils; Constants of ——. Lund 756

Hevea rubber. *See under* Rubber.

Hevea braziliensis; Coagulation of the latex of ——, and its bearing on the strength of rubber. Barritt 289

Hexa-amino-arsenobenzene: Manufacture of ——. (P) Boehringer und Söhne 41, 438

Hexamethylenetetramine and hydrogen peroxide; Preparation of a solid stable compound containing ——. (P) Diamalt A.-G. 220

Hexamethylenetetramine di-iodide; Preparation of ——. (P) Rix 943

Hexamethylenetetramine-methyl borate; Preparation of ——. (P) Schmitz 807

Hexamethylenetetramine-methyl thiocyanate; Preparation of ——. (P) Schmitz 43, 375, 439, 440*r*

2.4.6.2′.4′.6′-Hexanitrodiphenyl sulphide; Preparation of —— and its use in making explosives:
(P) Hartmann 161*r*, 161*r*
(P) Sprengstoff A.-G. Carbonit 44

Hexanitroethane. Will 441

Hexoses; Formation of aldehyde during fermentation of ——. Neuberg and Kerb 37

Hide fleshings preserved with formaldehyde; Glue from ——. Verein Deutscher Lederleimfabriken 1021
powder; Adoption of standard —— 1163
Treatment of raw ——. (P) Henderson, and Henderson Rubber Co. 606
trimmings; Fat as a by-product in the manufacture of glue from ——. Dubovitz 428

Hides; Depilation of ——. Rogers 152
Disinfection of —— in the manufacture of leather. (P) Röhm 153*r*
Manufacture of glue from ——. Cambon 974
Method of dressing ——. (P) Brooks 606
Method of storing ——. (P) Allen 840
Preparation of —— for tanning and dyeing. (P) D'Huart 326
Process for degreasing ——. (P) Filhol 326, 932*r*
Process for depilating and reducing ——. (P) Röhm 153*r*
Process for tanning ——. (P) Kimball and Borders 326
Relation between green salted weight and white weight of various portions of ——. Loveland 1163
Report of International Commission for the preservation, cure, and disinfection of ——. Seymour-Jones 653
The salting of —— and the avoidance of so-called salt stains. Romana and Baldracco 839
Treatment of —— to destroy anthrax or other disease germs. (P) Rhys-Davies 477
Treatment of —— with liquids. (P) Loschkareff 365
Treatment of —— before tanning. (P) Moore and Trantom 326, 432*r*

Homogenising liquids; Method of ——. (P) Berberich 302

Homonataloïn; Constitution of ——. Léger 275
and nataloin; Optical isomerides of —— and their reciprocal transformation. Léger 611

Homopiperonylamine; Preparation of N-monoalkyl derivatives of ——. (P) Decker 220

Honey; Determination of formic acid in ——. Lührig and Doepmann 1103
Determination of sulphur in ——. Nottbohm and Weinhausen 561
Enzymes of ——. Gothe 1217

Honeys; Examination of Belgian ——. Ledent 433

Hop bitter substances; Determination of —— by cold extraction with carbon tetrachloride. Seibriger 37

Hoppers for blast-furnaces, gas producers, etc. (P) Babcock and Wilcox Co. 1148

Hops; Aroma of ——. The volatile oil in relation to the geographical origin of the hops. Rabak 707
Nitrogenous constituents of ——. Chapman 879
Production of extracts from ——. (P) Von Horst 659

Hordenine; Phenol bases homologous to ——. Von Braun 332

Horn; Manufacture of products similar to —— from albuminous materials, etc. (P) Plinatus 558, 559
Manufacture of substances similar to —— from leather scrap:
(P) Damgaard 655*r*
(P) Damgaard and Rasmussen 432
Process for dissolving —— rapidly. (P) Contant and Perrot 877

Hornbeam leaves; Volatile constituents of ——. Curtius and Franzen 1026

Horsehair; Manufacture of artificial ——. (P) Sanlaville 546*r*
Production of artificial —— from nitrocellulose solutions. (P) Berl and Isler 746

Horticulture; Use of hydrocyanic acid in ——. Sargeant and Edwards 877

Human bodies or their organs; Hardening or mummifying ——. (P) Fratarcangeli 372*r*

Humic substances; Influence of —— on the weathering of silicates. Niklas 1164

Humus of acid and alkaline peats; The ——. Hanley 210
in heavy clay soils; Determination of ——. Beam 153
The nitrogen of ——. Kelley and Thompson 270

Hungarian natural-gas wells 851

Hungary; Chemical trade in —— 1206
Results of drilling fertilisers in ——. Kerpely 35

Hurter Memorial Lecture. Haber 49

Hydramines and hydramine-ethers; Preparation of ——. Houben and Führer 1113

PAGE
Hydrastinine and its homologues; Preparation of salts of ——. (P) Decker 220
  Preparation of —— from dihydrohydrastinine. (P) Bayer and Co. 220, 503r
Hydrastis alkaloids; Determination of ——. Gsell 885
Hydrating sand-lime mixtures, etc.; Apparatus for ——. (P) Sutcliffe 27r
Hydrazine salts; Reduction of chlorates to chlorides by —— with the aid of a catalytic substance. Hodgkinson 815
Hydrazoic acid; Manufacture of ——. (P) Staudinger ... 693
  New salts of ——. Wöhler and Martin 768
Hydrocarbon content of concentrated lemon oils; Determination of the ——. Böcker 275
  flames; Water-gas equilibrium in ——. Andrew 303
  liquids; Increasing the lighting and heating efficiency of ——. (P) Swanberg 586
  mixtures; Treatment of liquid ——. (P) Hense 16
  residues; Distillation and cracking of light ——. (P) Von Groeling 586
Hydrocarbonaceous substances; Apparatus and process for treating ——. (P) Scott 1150
Hydrocarbons allied to terpenes; Synthetic ——. Haworth and Fyfe 766
  Autoclave apparatus for transforming ——. (P) Renard 345
  from carbides; Production of ——. (P) Tischenko and Plauson 244
  with conjugated double linkages; Preparation of unsaturated ——. Kyrlakides 502
  Conversion of aliphatic —— into alcohols. (P) De Lattre 953
  Conversion of carbon into ——. (P) Tischenko and Plauson 412
  Conversion of heavy into lighter ——:
    (P) Hall 1149
    (P) Planes, Ltd., and Thompson 542
  Conversion of higher boiling into lower boiling petroleum ——. (P) Gray 1044
  Conversion of —— into lampblack. (P) Bosch 429
  Conversion of mineral —— into oils of lower boiling point. (P) Zerning 304r
  Conversion of —— into products of lower boiling point. (P) Renard 412
  Dehydration of ——. (P) Dubbs and Dunham 824
  and their derivatives; Production of ——. (P) Badische Anilin und Soda Fabrik 984
  Detection and determination of solid —— in admixture with fatty acids. Verona-Rinati 1214
  dissolved in mineral waters; Determination of gaseous ——. Hauser 336
  Distillation of ——:
    (P) Rosen 246
    (P) Soc. Anon. des Combustibles Industriels .. 246r
  Electrically-heated boiler or still for liquid ——. (P) Delort 954
  Electrochemical oxidation of aromatic ——. Fichter and Stocker 755
  Hydrogenation of cyclic —— by means of sodammonium. Lebeau and Picon 637
  Hydrogenation of polycyclic —— by sodammonium. Lebeau and Picon 913
  Manufacture of a combustible liquid from heavy ——. (P) Hall 853
  Manufacture of gas or hydrogen by decomposing the vapours of liquid ——. (P) Berlin Anhaltische Maschinenbau A.-G. 190
  Manufacture of unsaturated ——:
    (P) Matthews and others 43r
    (P) Perkin and others 374
  Manufacture of volatile ——. (P) Hense 347
  Method of dehydrating ——. (P) Hering 757
  in natural gas; Process for separating the ——. (P) Koppers, and Koppers Co. 1002
  from peat; Extraction of liquid —— or their halogen derivatives. (P) Tischenko and Plauson 244
  Polymerisation of diethylenic ——. Lebedeff .. 1223, 1224
  from polymethylenes or mixtures containing them; Manufacture of aliphatic ——. (P) Sommer 767
  from polymethylenes; Preparation of aliphatic ——. (P) Steaua Romana Petroleum Ges. 191
  Preparation of sulphur derivatives of ——. (P) Steinkopf 278r
  Process for obtaining liquid ——. (P) Schill, and Continental Gas Compressing Corporation 824
  Production of oils and other products from materials containing ——. (P) Wilson 912
  Purification of liquid ——. (P) Richter 741r
  Separation of —— by means of liquid sulphur dioxide. Edeleanu 343
  Separation of mixtures of saturated and unsaturated —— by means of potassium permanganate. Nametkine 1229
  Separation of mixtures of unsaturated aliphatic ——. (P) Du Pont de Nemours Powder Co. 334r, 334r
  Simultaneous oxidation of saturated and unsaturated —— by potassium permanganate. Kishner 502
  Treatment of ——:
    (P) Rosen 586
    (P) Soc. Anon. des Combustibles Industriels .. 826r
  Treatment of heavy ——. (P) Hyndman 345
  Treatment of petroleum ——. (P) Bacon and Clark .. 824
  in turpentine oil; Detection of ——. Utz 1099

PAGE
Hydrocarbons—*cont.*
  with two double linkages; Isomeric transformations of ——. Kutscherow 333
  of Utah. Bardwell and others 15, 1043
Hydro-carotin. Beschke 711
Hydrochloric acid; Action of —— on alcohol. Kilpi 1115
  Apparatus for condensing ——. Friedrich 309
  Continuous production of dry —— from potassium chloride and sulphuric acid. (P) Meyer and Klages 750r
  Determination of arsenic in ——. Tarbell 590
  Determination of arsenic in ——. Rapid method. Koelsch 74
  Manufacture of ——. (P) Nield, and General Chemical Co. 864
  pickle liquors; Apparatus for treating waste ——. (P) Starck 421
  Solubility of silica in ——. Wunder and Suleimann .. 279
  solutions; Precise standardisation of ——. Andrews .. 1116
  vapours; Apparatus for condensing ——. (P) Leblanc 311
Hydrochlorides of primary aromatic amines and their derivatives; Isolation of —— from reduction products of nitro- and other compounds. (P) Pomeranz 246
Hydrocyanic acid; Catalytic combustion of —— to nitric oxide. Moldenhauer and Wehrheim 748
  content of cherry-laurel leaves. Wester 332
  in crude coal gas; Recovery of the nitrogen of the —— as an ammonium salt. (P) South Metropolitan Gas Co., and Evans 953
  in feeding stuffs; Determination of ——, and its occurrence in millet and Guinea corn. Furlong .. 1069
  Formation of —— in the distillation of coal. Simmersbach 781
  from linseed; Rate of liberation of ——. Collins and Blair 273
  Manufacture of —— from gas-purification residues. (P) Fabr. de Prod. Chim. de Thann et de Mulhouse, and others 255
  Preparation of —— by destructive distillation of beet molasses. Albers 36
  Production of gases containing —— in the electric arc. (P) Konsortium f. Elektrochem. Industrie .. 200
  from retort gases; Recovery of ——. (P) Coleman .. 23
  Use of —— in horticulture. Sargeant and Edwards 877
Hydro-extractors:
    (P) Irwin 1041
    (P) Poland 583
  Centrifugal ——. (P) Longsdon 950
Hydrofluoric acid. Ruff and Braun 350
Hydrogen; Absorption and adsorption of —— by palladium. Halla 280
  Absorption and adsorption of —— by wood charcoal at the temperature of liquid air. Firth 130
  Absorption of —— by palladium and palladium alloys. Sieverts 751
  Absorption of —— by refined copper. Stahl 1158
  and air; Dilution-limits of inflammability of mixtures of ——. Coward and Brinsley 851
  Apparatus for the electrolytic production and collection of ——. (P) Benker 256
  Apparatus for producing —— by alternate oxidation and reduction of iron. (P) Messerschmitt 137, 256r, 256r, 866r
  and cerium; Reciprocal action of ——. Joukoff 1206
  Determination of —— by a modification of the Jaeger method. Wibaut 823
  Dissociation of —— into atoms. Langmuir and Mackay 919
  Electrolytic cell for generating ——. (P) Burdett, and Burdett Manufacturing Co. 322
  Electrolytic generator for oxygen and ——. (P) Ellis 362
  Electrolytic production of ——. (P) Knowles Oxygen Co., Ltd., and Grant 24, 354r
  from formates; Technical production of ——. Levi and Piva 310
  or gaseous mixtures containing it; Process and apparatus for bringing —— to reaction. (P) Pier 485
  from iron ore and steam; Reducing and oxidising apparatus for generating ——. (P) Berlin-Anhaltische Maschinenbau A.-G. 256, 593r
  Manufacture of ——:
    (P) Badische Anilin und Soda Fabrik 22, 24, 24r, 201r, 256, 550r, 593r, 831r, 831r, 1047r, 1154r
    (P) Berlin-Anhaltische Maschinenbau A.-G. 920
    (P) Ellis 550
  Manufacture of —— by decomposing the vapours of tar, oil, or liquid hydrocarbons. (P) Berlin-Anhaltische Maschinenbau A.-G. 190, 586r, 783r
  Manufacture of —— by decomposition of steam. (P) Pintsch A.-G. 920
  Manufacture of —— together with carbon monoxide and nitrogen. (P) Brownlee and others 1002
  and nitrogen; Manufacture of mixtures of —— suitable for making ammonia. (P) Koepp und Co., and others 788, 866r
  number of some essential oils and essential oil products. Albright 1113
  and oxygen; Action of radium emanation on mixtures of ——. Scheuer 918
  and oxygen: Catalytic effect of kaolin on the union of ——. Joannis 254

PAGE
Hydrogen—*cont.*
  and oxygen: Catalytic influence of copper oxide on the combination of ——. Joannis 787
  and oxygen: Ignition points of mixtures containing electrolytic ——. Dixon and Crofts 909
  Preparation of —— by auto-combustion. (P) Jaubert 750*r*
  Preparation and commercial uses of ——. Crossley .. 1135
  under pressure; Method of working with ——. (P) Badische Anilin und Soda Fabrik 256*r*
  Process for liquefying commercial —— by expansion. (P) Lilienfeld 1154
  -producing plant; Means combined with —— for regulating fluid pressures therein. (P) Dempster 1046
  Production of —— by alternate oxidation and reduction of iron. (P) Messerschmitt 136, 137, 313, 313, 593*r*, 593*r*, 201, 866*r*, 962*r*, 962*r*
  Production of —— by means of hydrocarbons and steam. (P) Badische Anilin und Soda Fabrik .. 313
  Purification of ——. (P) Badische Anilin und Soda Fabrik 256
  Rate of solution of —— by palladium. Holt 571
  Solubility of —— in iron. Jurisch 1053
  Use of manganese and iron ores in the catalytic production of ——. (P) Messerschmitt 201
  from water; Electrolytic apparatus for producing ——. (P) Soc. Anon. l'Oxhydrique Française 24*r*, 76

Hydrogen peroxide; Compound for making ——. (P) Jacobs 312
  Decomposition of —— in alkaline solutions. Schenck and others 592
  Determination of acetanilide in ——. Marden 501
  Determination of —— at high dilutions, and its distinction from oxygen and nitrogen peroxide. Pring 254
  Displacement of acids from salts by ——. Sperber .. 135
  Electrolytic manufacture of ——. (P) Henkel und Co. 644, 693, 831*r*
  and hexamethylenetetramine; Preparation of a solid, stable compound of ——. (P) Diamalt A.-G. 220
  Increasing the keeping qualities of ——. Action for infringement of Sarason's patent 963
  Manufacture of ——:
    (P) Henkel und Co. 353*r*, 962*r*
    (P) Pietzsch and Adolph 200, 646*r*
  Manufacture of stable ——. (P) Schadhauf, and Roessler and Hasslacher Chemical Co. 1009*r*
  Photochemical decomposition of ——. Mathews and Curtis 352, 691
  Preservation of ——. Walton and Judd 1086
  Preservation of —— by means of acetanilide. Clover 21
  Process for increasing the stability of —— in neutral liquid or solid media. (P) Merck 831
  Process for stabilising caustic alkaline solutions of ——. (P) Deutsche Gold- u. Silberscheide Anstalt vorm. Rössler 76, 750*r*
  solutions; Process for preventing the decomposition of ——. (P) Farago and Gonda 831, 831*r*
  Synthesis of 100 per cent. —— by the silent electric discharge. Wolf 420

Hydrogen sulphide from artificial graphite. Woodcock and Blount 255
  from coal gas; Separation of ——. (P) Bergh 542
  Colorimetric determination of small quantities of ——. Mecklenburg and Rosenkränzer 352
  from gases; Process for removing ——. (P) Burkheiser 412*r*
  Process for producing ——. (P) Hall 137*r*
  Production of sulphur from —— by treatment with sulphur dioxide. (P) Feld 692

Hydrogenating fats; Osmium dioxide as a catalyst in ——. Normann and Schick 756
  fatty acids and other organic compounds; Process for ——. (P) Wimmer and Higgins 32*r*
  oils and fats; Metallic catalysts for use in ——. (P) Byrom 757
  oils and the like; Apparatus for ——. (P) Ellis 428
  oils, etc.; Manufacture of catalytic material for ——. (P) Ellis 32
  oily material; Process for ——. (P) Ellis 208*r*, 208*r*
  organic substances; Process for ——:
    (P) Lessing 43*r*
    (P) Verein. Chininfabr. Zimmer und Co. 844

Hydrogenation. (P) Brochet 890*r*
  Catalytic ——:
    (P) Adam 1226
    (P) Brochet 18
    Crossley 1137
    Sabatier 735, 736
  of compounds with aliphatic ethylenic linkages, in presence of nickel under atmospheric pressure. Brochet and Cabaret 1113
  of compounds with aliphatic ethylenic linkages, in presence of nickel under moderate pressure. Brochet and Bauer 1113
  of fats; Catalytic ——. Bontoux 929
  of liquids; Catalytic —— at moderate temperature and pressure. Brochet 612
  of phenols with unsaturated side chains; Catalytic ——. Ipatiew 17
  of polycyclic hydrocarbons by sodammonium. Lebeau and Picon 913
  Preparation of catalysts for ——. (P) Ellis 208, 208

PAGE
Hydrogenations; Reaction velocities of catalytic —— in presence of platinum black. Vavon 276

Hydroglucal, a reduction product of dextrose. Fischer .. 211

Hydro-ipecamine in true ipecacuanha root. Hesse 611

Hydrolytic agent for oils and fats; Preparation of a solid or liquid ——. (P) Sudfeldt und Co. 429
  agents; Sulphuric acid and sulphonic acids as ——. Armstrong and Worley 960

Hydrometer and specific gravity tables. Joseph and Rae 991

Hydrometers. (P) Lucas and Smart 1117
  Sikes' ——. Natural Physical Laboratory Report ... 893

Hydrostrychnine reagent for the colorimetric determination of nitric acid in water; Preparation of the ——. Denigès 1070

Hydrosulphites; Analysis of ——. Wild 1046
  Direct preparation of anhydrous —— from aqueous hydrosulphite solutions. (P) Chem. Fabr. Griesheim-Elektron 76, 790*r*
  Electrolytic preparation of ——. (P) Badische Anilin und Soda Fabrik 920
  Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron 865, 865*r*
  Manufacture of anhydrous ——. (P) Kinzlberger und Co. 643, 921*r*

Hydro-urushiol; Derivatives of ——. Majima and Nakamura 91
  dimethyl ether; Synthesis of homologues of ——. Majima and Nakamura 91

Hydroxides; Behaviour of some metallic —— with solutions of ethylenediamine. Traube and Loewe 692
  Electrolytic manufacture of metallic ——. (P) White 352
  Preparation of metallic ——. (P) Cochlovius 484, 485*r*, 550

Hydroxy-acids; Decomposition of —— with soda-lime. Carpenter 102
  Preparation of acid chlorides of ——. (P) Karczag and Kopetschni 943*r*

Hydroxyanthraquinones; Examination of —— with reference to their dyeing properties. Hüttig 589

Hydroxyanthraquinonesulphonic acids; Manufacture of chromium compounds of ——. (P) Badische Anilin und Soda Fabrik 348*r*

p-Hydroxyarylarsinic acids; Application to suspend a patent for —— 1028

o-Hydroxyazo compounds derived from α-naphthol. Charrier and Casale 827

Hydroxybenzoyl-*o*-benzoic acids, their homologues and derivatives; Preparation of esters of ——. (P) Bayer und Co. 277

Hydroxycarboxydiarylcarbinols; Manufacture of ——. (P) Bayer und Co. 161*r*

Hydroxy compounds; Pyrogenetic decomposition and catalytic dehydration of ——. Kyriakides 612

Hydroxy derivatives; Production of aromatic ——. (P) Act.-Ges. f. Anilinfabr. 955

Hydroxy-fatty acids; Manufacture of esters of ——. (P) Chem. Werke vorm. Dr. H. Byk 375*r*

Hydroxyl groups; Determination of —— by means of alkylmagnesium halides, using pyridine as solvent. Tanberg 279

Hydroxylamine; Detection and determination of ——. Schroeder 567

Hydroxylamine nitrite and other salts; Preparation of ——. (P) Toelle und vom Hofe, and Kronen 667

Hydroxymethylanthraquinones in rhubarb, senna, and cascara; Determination of the free and combined ——. Daels 1071

ω-Hydroxy-*s*-methylfurfuraldehyde; Production of —— from carbohydrates, and its influence on the determination of pentosans and methylpentosans. Cunningham and Dorée 1024

2-Hydroxy-1-naphthoic acid; Use of —— in printing. Heilmann et Cie., and Battegey 860

2.3-Hydroxynaphthoic acid anilide and its use in calico printing. Lomanowitsch 1203
  arylides and formaldehyde; Manufacture of condensation products from ——. (P) Chem. Fabr. Griesheim-Elektron 742
  Manufacture of arylides of ——. (P) Chem. Fabr. Griesheim-Elektron 70, 475*r*, 742*r*
  arylides; Manufacture of azo dyestuffs from ——. (P) Chem. Fabr. Griesheim-Elektron 915
  arylides; Use of —— in dyeing and printing. Kunert and Acker 479

4-Hydroxyphenylalkylglycines as photographic developers. (P) Act.-Ges. f. Anilinfabr. 440

p-Hydroxyphenylethylamine in normal cheese; Occurrence of —— and its formation by lactic bacteria. Ehrlich and Lange 659

p-Hydroxyphenyltrimethylammonium salts; Preparation of pure stable ——. (P) Chem. Fabr. vorm. Sandoz 845, 985*r*

Hydroxyphthalimidine; Preparation of ——. (P) Kalle und Co. 193

6-Hydroxy-2-piperonylquinoline-4-carboxylic acid; Manufacture of ——. (P) Chem. Fabr. vorm. Schering 766

PAGE
Hypnotic; *Gelonida somnifera*, a new ——. Zahn 983
Hypoborates obtained by the interaction of gaseous boron hydrides and bases. Stock and Kuss 549
Hypochlorite bleaching liquors; Continuous production of ——. (P) Deutsche Solvaywerke 790
Hypochlorites; Stability and oxidation-potential of ——. Contribution to catalysis and a hypochlorite-carbon cell. Hofmann and Ritter 917

Illipé nuts. Voigt 972
  oil from Mauritius.................................. 147
Imides of alkaline-earth metals. Dafert and Miklauz 21
Imperial Institute. Technical Information Bureau 1038
Imports; Prohibited British ——. 1038
Impregnating compositions; Manufacture of ——. (P) Eberhard 33r, 267
  fabrics, cords, cables, etc.; apparatus for ——. (P) Destribats 133
  materials. (P) Von Walther 134r
  materials which are difficult to permeate completely; Process for ——. (P) Weller 252
  materials; Manufacture of ——. (P) Roth 605r
  substance from sulphite pulp waste lyes; Preparation of an ——. (P) Pollacsek 248, 746r
  wood or other porous bodies; Apparatus for ——:
    (P) Moll 356, 867r
    (P) Galloway and Frame 315, 356r, 867r
Incandescence bodies for electric glow lamps; Manufacture of ——:
    (P) Bastian 1197
    (P) Just 686
  bodies for electric lamps. (P) Hughes 954
  bodies for electric lamps, furnaces, etc. (P) Podszus .. 474
  bodies of tungsten for lamps; Manufacture of ——. (P) Comp. Franç. pour l'Exploit. des Procédés Thomson-Houston 346r
  bodies made of tungsten or similar metal; Manufacture of —— of uniform diameter. (P) Allgem. Elektricitäts-Ges. 1150
  electric lamp filaments of cobalt; Manufacture of ——:
    (P) Kanazawa 192r
    (P) Tanimura 69
  electric lamp filaments; Manufacture of fibrous tungsten for ——. (P) General Electric Co. 143
  electric lamps:
    (P) General Electric Co. 130, 913
    (P) Mackay 1004
  electric lamps: Liberation of gases or vapours from chemical compounds in ——. (P) Siemens und Halske A.-G. 69
  electric lamps; Manufacture of ——. (P) Simpson 854
  electric lamps; Manufacture of metallic filaments for ——. (P) Scoular, and Dick, Kerr and Co., Ltd. 854, 854r
  electric lamps; Manufacture of refractory bodies for ——. (P) Podszus 70
  gas lighting: Impregnation of the filaments and mantles used in ——. (P) Bagrachow 955r
  gas mantles; Manufacture of ——. (P) Robin 474
  lamp filaments; Treatment of ——. (P) Henderson, and Westinghouse Lamp Co. 305
  mantles:
    Haber 51
    Stern 69
Incinerator; The evolution of the ——. Kohlmann 383
Income of the Society during 1913 619
Incrustation in boilers and the like; Prevention of ——. (P) Radaeff 407
India; Camphor production in —— 1226
  Cus-cus (vetivert) oil of ——. Singh 886
  Fish guano from —— 494
  Fish oil from —— 491
  Indigo production in —— 638
  Lemon-grass oil from —— 805
  Pitchblende discovery in —— 749
  Radium in —— 1206
Indian beeswax. Fischer 90
  seeds; Urease-content of certain ——. Annett 1118
Indicator; Dihydroxydibenzalacetone (lygosine) as a new ——. Ferencz 1075
  Use of 1.6-dihydroxynaphthophthalein as an ——. König 1084
Indigo; New derivatives of ——:
    Engi 854
    Kunckell 305
    Levinstein 574
  Discharge printing on —— with hydrosulphite and without steaming. Coloured discharge printing with azo and vat dyestuffs. Justin 859
  discharges with aid of bromine compounds. Freiberger 309
  dyeing apparatus. (P) Becker and Mueller 73
  dyestuffs in the colloidal condition. (P) Badische Anilin und Soda Fabrik 194
  dyestuffs; Preparation of finely-divided or colloidal ——. (P) Meister, Lucius, und Brüning 217r, 588r
  dyestuffs for wool; Manufacture of yellow ——. (P) Meister, Lucius, und Brüning 195
  Halogenated —— and derivatives. Grandmougin and Seyder 854
  its homologues or substitution products; Preparation of ——. (P) Meister, Lucius, und Brüning 784
  Preparation of substitution products of ——. Reissert 347
  The process of oxidation of —— by permanganate. Wagner 475
  Production of coloured discharges on —— by means of vat dyestuffs. (P) Gebr. Enderlin 418
  production in India 638
  Production of white or coloured discharges on ——. (P) Sunder, and Ribbert A.-G. 252
  Renewed interest in natural —— 1200
  Solubility of —— in dimethyl sulphate. Peachey 395
  syntheses; New ——. Madelung 587
  vat; Preparation suitable for the ——. (P) Meister, Lucius, und Brüning 639r
  and wool; A chemical compound obtained from ——. Fort and Lloyd 958
  on woollen cloths; The testing of —— 133
Indigoid dyestuffs. Friedländer and Risse 687
  Manufacture of ——:
    (P) Bayer und Co. 639, 784, 784r
    (P) Kalle und Co. 416
    (P) Meister, Lucius, und Brüning 476
  New derivatives of ——. Engi 854
  Treatment of insoluble ——. (P) Badische Anilin und Soda Fabrik 247
Indoxyl; Formation of —— from phenylglycine by alkali fusion. Feuchter 414
Indulines; Effect of magnesium chloride on the oxidising action of chlorates and nitrates in the preparation of ——. Hofmann and others.................... 742
Indurated articles: Production of ——. (P) Aylsworth, and Condensite Co. of America 1063
Infant's foods; Analysis and composition of some proprietary ——. Baker 882
Inflammability of gaseous mixtures; Dilution limits of ——. Coward and Brinsley 851
Inflammable gases in air; Detection and determination of ——:
    (P) Akkumulatorenfabrik 190, 190, 244, 505r
    (P) Kraushaar 190
  gases; Indicator of ——. (P) Guasco 378r
  gases; Means for detecting —— especially for use in mines. (P) Manley and Sandy 910
  liquid; Working in closed vessels in which material is treated with —— in presence of a protective gas. (P) Martini u. Hüneke Maschinenbau A.-G. 13, 241r
  liquids; Conveying and storing ——. (P) Martini u. Hüneke Maschinenbau A.-G. 64, 64
  substances; Electrostatic separators for treating ——. (P) Kraus 681
  substances in gaseous mixtures; Determination of ——. (P) Eyermann 809
Infusible white precipitate: Constitution of ——. Saha and Choudhury 351
Ingot-heating furnaces; Continuous ——. (P) Siemens 318, 321r
Ingots; The making of sound steel ——. Stoughton 140
  of metals and alloys; Method and apparatus for casting ——. (P) Durville 699
  Process for casting ——. (P) Melaun 792
  Thermal treatment of steel ——. (P) Soc. Anon. Italiana Gio. Ansaldo & Co. 144r
Injection of chemicals: Apparatus for the automatic measuring and ——. Parsons 515
Injuries to life and limb in explosives and other works in Germany 890
Ink. (P) Price 429
  Luminous ——. (P) Krapf and Flannery 798
  Manufacture of printing ——:
    (P) Sureties.................................. 798
    (P) Wolff 267r, 557r
  Removal of —— from printed paper. Wangner 858
Inks; Extraction apparatus for use in examination of iron-gall ——. Kempf 306
  for printing machines; Composition of ——. (P) Heyl and Baker 604
Inoculating substances from bacteria; Preparation of efficacious ——. (P) Kalle und Co. 889
Inorganic enzymes and their application for baking purposes. (P) Weil 802
  substances; Electro-osmotic removal of water from ——. (P) Ges. f. Elektro-Osmose 871, 871

Inositol, Synthesis of natural ——. Wieland and Wishart 770
Insecticide. (P) Ellis, and Chadeloid Chemical Co. 159
for plants and its manufacture. (P) Fischer 331
Insectifuge; Manufacture of a solidified oil for use as ——. (P) Ellis, and Ellis-Foster Co. 1025
Insects in furs, skins, etc.; Process for destroying ——. (P) Act.-Ges. f. Anilinfabr. 640r
Process for killing ——. (P) Act.-Ges. f. Anilinfabr. 939, 939r
Insulating coatings; Methods of forming and applying ——. (P) Holmes and others 796
composition:
(P) Kelly 33, 492r, 605r
(P) Locke 490
compound. (P) Edison 145
compound; Thirty per cent. *Hevea* ——. Specifications and analytical procedure 150
material; Electric ——. (P) Aylsworth, and Halogen Products Co. 601
material free from organic substances; Manufacture of light ——. (P) Duchemin 427
material; Manufacture of ——. (P) Peabody, and Republic Manufacturing Co. 146
materials; Manufacture of electric ——:
(P) Aylsworth, and Condensite Co. of America 491r
(P) Boehm 321
(P) General Electric Co. 322, 322, 364, 490, 491r, 651r, 1020
materials; Manufacture of heat ——:
(P) Armstrong Cork Co. 965
(P) Scharwath 486
materials; Manufacture of plastic ——. (P) Regal 974
powder for electrical purposes; Fusible ——. (P) Grossmann 322
wire of aluminium and the like; Method of ——. (P) Presser 1214r
Insulation for refrigerating rooms; Heat ——. Thornton 998
Intermetallic compounds; Capacity for heat of —— between 18° and 600° C. Schübel 649
International Congress of Mining, Metallurgy, etc., 1915; Postponement of the —— 847
Inulin; Behaviour of some *Saccharomycetes* to ——. Grafe and Vouk 880
Invention in chemistry. Potts 392
Invertase action; Different causes of inhibition of ——. Michaelis and Pechstein 272
action; Reversibility of ——. Blagowestchenski 561
Action of —— on sucrose in methyl and ethyl alcohols. Bourquelot and Bridel 434
Chemical constitution of ——. Nelson and Born 271
Formation of ——. Euler and Cramér 97
Influence of temperature and aeration on the formation of ——. Euler and Cramér 272
Is the inversion of sucrose by —— reversible? Hudson 802
solutions; Preparation of strong —— from top or bottom yeast. Hudson 802
A thermo-stable form of ——. Durieux 561
of zymin and dried yeast. Harden and Zilva 761
Iodides; Direct iodometric determination of soluble ——. Stüwe 547
Double —— containing two solvents of crystallisation. Marsh 1205
Iodometric determination of ——. Müller and Wegelin 21
Iodine; Apparatus for subliming ——. (P) Le Gloahec 962
Biochemistry of ——. Distribution of iodine in plant and animal tissues. Cameron 942
from caliche; Recovery of ——. (P) Sulman and others 24
Determination of —— especially in organic substances. Grützner 713
Gases retained by ——. Guye and Germann 922
in halide salts; Determination of —— by means of telluric acid. Cole 1007
from marine algae; Extraction of ——. (P) Laurent 920
from marine plants; Extraction of ——:
(P) Gloess 920r
(P) Gloess and Darrasse 920
in oils; Detection and determination of small quantities of ——. Fendler and Stüber 148
in organic compounds; Determination of ——. Eckardt 891
Solubility of —— in sodium iodide solution. Gill 254
solutions; Titration of alkaline ——. Leclère 1117
tincture; Permanent ——. Courtot 160
tincture; Regeneration of altered ——. Roques 613
value of fats; Determination of the ——. Weiser and Donath 872
values of oils; Determination of the ——. Meigen and Winogradoff 556
Iodine compounds; Preparation of organic ——. (P) Sander 890
Iodometry; Picric acid as a standard substance in ——. Sander 441
Ionisation of gases; Apparatus for measuring ——. (P) Siemens und Halske A.-G. 90r
Ipecacuanha; The alkaloids of ——:
Carr and Pyman 764
Keller 331
alkaloids; Process for obtaining ——. (P) Chem. Werke vorm. Dr. H. Byk 43
root; Alkaloids of true ——. Hesse 610

PAGE
Iridium: Determination of —— in platinum-iridium alloys. Bannister and du Vergier 922
Separation of platinum from ——. (P) Verein Chem. Fabriken in Mannheim 699
World's production of ——. Hänig 595

Iron; Action of concentrated sulphuric acid on ——. Fawsitt and Powell 234
Addition of titanium-iron alloys to foundry ——. Braune 1090
Advances in the metallurgy of ——. Hadfield 648
alloy:
(P) Pittsburg Iron and Steel Foundries Co. 836r
(P) Speer 925
alloy product and its manufacture. (P) International Metal Products Co. 1214
and its alloys; Cementation of ——. (P) Captain and Krieger 597
alloys; Determination of titanium and vanadium in ——. König 315
alloys; Fixation of nitrogen by means of ——. (P) Soc. Générale des Nitrures 483
alloys; The hardening of ——. Edwards and Carpenter 552
alloys; Hot working ——. (P) Carnahan 925
alloys; Manufacture of ——. (P) Colvocoresses 968
alloys; Process for improving the magnetic qualities of ——. (P) Hadfield 143
alloys; Production of ——. (P) Goldmerstein 793, 795r
alloys; Rapid determination of carbon in ——. Szász 994
alloys; Use of slags from the electric furnace manufacture of —— for making Portland cement. (P) Viélajus 422
and aluminium; Analytical separation of ——. Borck 104
Analysis of ——. Methods of U.S. Bureau of Standards 139
Analytical separation of zirconium from —— by means of "cupferron." Thornton and Hayden 944
articles; Cementation of ——. (P) Giolitti, and Soc. Anon. Italiana Gio. Ansaldo, Armstrong & Co. 554r
articles; Process for case-hardening ——. (P) Burian, and Gebr. Schubert 426r
bars broken at different temperatures; Physical properties of cast ——. Perrine and Spencer 1156
from blast-furnace dust; Process and apparatus for recovering ——. (P) Billard 488
blast-furnace flue dust; Method of utilising ——. (P) Baggaley 85
blast-furnace slags; Utilisation of the waste heat of —— 594
blast-furnace; Use of dry air in the ——. Girvin 283
The brittleness produced in —— by deformation at different temperatures. Charpy 1011
-carbon alloys; Hardness of ——. Andrew 359
-carbon alloys; The hardness and electrical resistance of ——. Vondracek 695
and carbon; Manufacture of agglomerates of reduced ——. (P) Aarts 697
carbon, and phosphorus; Some of the ternary alloys of ——. Stead 173
Cast —— and process for producing same. (P) Anderson 318
castings; Kilns for annealing ——. (P) Gibbons and others 1214
castings; Local hardening of malleable ——. (P) Vickers, Ltd., and Sumpter 968
castings; Malleable ——. Ford 1156
castings; Study of the annealing process for malleable ——. Storey and Leasman 695
cementation of ——. Recent developments and researches. Guertler 1090
-cerium alloys; Analysis of pyrophoric ——. Arnold 754
Chilled cast ——. Tilt 1210
Coating —— with copper. (P) Sheaffer 1214
Colorimetric determination of sulphur in pig ——. Misson 551
Composition to be applied to —— for preservative purposes. (P) Aglioubz and Howkins 652
Concrete-covered cast —— as a structural material. Von Emperger 81
in concrete; Electrolytic oxidation of ——. Rosa and others 486
Conversion of cast —— into steel or malleable iron. (P) Hunter 1057
Corrosion of —— by dissolved oxygen. Cobb and Dougill 403
"Crystallisation through fatigue" of ——. Rogers 83
Deposition of ——. (P) Cowper-Coles 925
Determination of arsenic in —— iodometrically. Brandt 28
Determination of carbon in —— by the barium carbonate titration method. Cain 696
Determination of carbon in —— by direct combustion in oxygen. Cain and Cleaves 966
Determination of carbon in —— by a rapid method. Szász 994
Determination of —— colorimetrically. Hüttner 614
Determination of —— iodometrically. Lander and Geake 376
Determination of phosphorus in ——. Phillips 423
Determination of —— in presence of phosphoric acid. Corfield and Pratt 845
Determination of titanium in —— colorimetrically. McCabe 1090
Diphenylcarbohydrazide as indicator in the bichromate titration of ——. Brandt 44
Direct determination of carbon in ——. Brown 696

Kilns
(P) Hultgren, and Wenborne-Karpen Dryer Co. 1000r
(P) Stevens 1041
for annealing wire coils, iron castings, etc. (P) Gibbons and others 1214
Brick and similar ——. (P) Blythe 259
Bricks or quarries for use in the bottoms of ——. (P) Phillips 355
for burning clay-ware; Continuous ——. (P) Legg 259
for burning gypsum; Gas ——. (P) Stein et Cie 551
for burning plaster of Paris. (P) Clement 356
for calcining lime, cement, and other material. (P) Crosland and Booth 833
Development of rotary —— and their application to various chemical and metallurgical processes. Meade 949
Drying ——. (P) Moranz, and Chicago Varnish Co. 908
for drying china clay, etc. (P) Oil-Flame Furnace Co., Ltd., and Buchholtz 81
Firing —— with pulverised fuel. (P) Brunner 341
Gas-fired ——. (P) Tooth 240
and heaters combined. (P) Allan 780
for making tiles, pottery, etc. (P) Dressler 486r, 540, 921r
Manufacture of refractory bricks from cement for lining rotary ——. (P) Pavin de Lafarge 356
Method of heating ——. (P) Jacobus, and Babcock and Wilcox Co. 412
Method of heating rotary tubular ——. (P) Engelhardt 637
The present status of producer-gas fired continuous —— in America. McElroy and Mumma 1051
Process for increasing the output of rotary —— especially as used for agglomerating iron ores. (P) Polysius Eisengiesserei u Maschinenfabrik 835
Rotary ——. (P) Riisager 906
Rotary —— for preparing iron ores for magnetic concentration. (P) Schröder 488
Rotary tubular —— for removing the chemically-combined water in pigments, especially zinc sulphide pigments, etc. (P) Küppers 798
for treating vegetable and mineral matter. (P) Waterhouse and Van Mater 950
Tunnel —— for tempering, cementation, etc. (P) Richter 206r

Kimmeridge shale of St. Champ, France; Oil rich in sulphur from ——. Demesse and Réaubourg 843

Kinematograph. *See* Cinematograph.

Kjeldahl's method for determining nitrogen; Modifications in ——:
Hottinger 442
Marino and Gonnelli 615
method; Some limitations of the ——. Dakin and Dudley 377
process; Destruction of large quantities of organic matter in the ——. Carplaux 105

Kol-kol gum from Northern Nigeria 495

Kublerschky column; Use of the —— in distilling mineral oils. Graefe 1146

Kukui oil 837

L

Lac; New alcohol and acid from stick ——. Gascard 875
Japan; The chief constituent of ——. Hydro-urushiol derivatives. Majima and Nakamura 91
Treatment of ——. (P) Freymuth 325

Lace; Coating —— with metal. (P) Holland and Holland 642

Lacmosol, the sensitive component of the indicator lacmoid. Hottinger 808

Lacquer. (P) Aylsworth, and Condensite Co. of America 757r
Burmese —— (Thitsi). Rosenthal 703
Chemically resistant glass ——. Fox 1215
composition. (P) Aylsworth, and Condensite Co. of America 931
fires; Extinguishing —— by sawdust 33

Lacquers; Manufacture of ——:
(P) Chem. Werke vorm. Dr. H. Byk 557
(P) Cohn 33r, 325
Manufacture of non-inflammable solutions of cellulose nitrate for use as ——. (P) Act.-Ges. f. Anilinfabr 93, 838r

Lacs; Process for refining ——. (P) Cassard 492r

Lactic acid in alcoholic fermentation; Formation of ——. Oppenheimer 156
bacteria in milk; Apparatus for cultivating ——. (P) Mott and others 330
from pyruvic acid; Question of the formation of —— by fermentation with living yeast. Neuberg and Kerb 608
from waste dough of cracker or biscuit bakeries; Production of ——. (P) Saxe 274
in wine; Determination of —— by Möslinger's barium chloride method. Baragiola and Schuppli 762
in wines; Determination of free and combined ——. Roettgen 97

Lactic esters as solvents for cellulose compounds, resins, etc.; Use of ——. (P) Chem. Werke vorm. Dr. H. Byk 557

Lactic ferment; Lack of hereditary accommodation of —— in feebly nutritive media. Richet 761
food products; Composition for producing ——. (P) Hansen 937

Lactid; Manufacture of ——. (P) Chem. Werke vorm. Dr. H. Byk 569r, 614r

Lactose in condensed milk; Determination of —— by means of acid mercuric nitrate. Revis and Payne 1166
content of cheese; The ——. Street and Mendel 1218
Determination of —— by the copper iodide method. Cole 657
Determination of —— by means of sodium hypoiodite. Bland and Lloyd 949
Influence of ammonium sulphate on the specific rotation of ——. Rosemann 156

Lævulose; Conversion of —— into mannitol by hydrogenation. (P) Lupieri and Meyer 977
Formation of formaldehyde and carbon monoxide by action of ultra-violet rays on ——. Ranc 705
Qualitative and quantitative tests for —— in presence of other sugars. Pinoff and Gude 657

Lakes from bisulphite compounds of azo dyestuffs; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 348r
Colour —— from purpurin derivatives:
(P) Bayer und Co. 492
(P) Thun and others 492r
Labile ——. Von Iljinsky 747
Manufacture of —— from anthracene dyestuffs. (P) Bayer und Co. 876
Manufacture of colour ——. (P) Meister, Lucius, und Brüning 267r
produced in dyeing cotton with basic dyes; Composition of the ——. Sanin 20

Lambang oil 837

Lamp bulbs; Means for improving a vacuum in ——. (P) Von Recklinghausen, and Cooper Hewitt Electric Co. 1004
Disappearance of nitrogen in a tungsten ——. Langmuir 245
filaments; Electric furnace for treating ——. (P) Coolidge, and General Electric Co. 651r
-filament; Zirconium ——. (P) Hansen, and General Electric Co. 193r
Uses of the concentrated filament tungsten —— in the laboratory. McDermott 245

Lampblack obtained by decomposing hydrocarbons; Process for freeing —— from gases. (P) Bosch 557
Preparation of —— from hydrocarbons or hydrocarbon mixtures. (P) Bosch 429

Lamps; Electric glow ——. (P) Nernst, and Nernst Lamp Co. 955
Electric incandescence ——:
(P) General Electric Co. 130, 913
(P) Mackay 1004
Incandescence bodies of boron for electric ——. (P) Podszus 474
Liberation of gases or vapours from chemical compounds in electric incandescence ——. (P) Siemens und Halske A.-G. 69
Manufacture of electric filament ——. (P) Von Welsbach, and Welsbach Light Co. 1004
Manufacture of electric incandescence ——. (P) Simpson 854
Use of transparent quartz in making mercury vapour ——. Gallois 354

Land; Improvement of marshy —— in Finland by addition of sand. Rindell 432

Landolphia vines; Elimination of the non-lactiferous portions of the bark of ——. (P) Goldreich and Palmer 430

Lantana Camara; Oil from the flowers and leaves of ——. Kanga 1073

Lanthana in monazite; Determination of ——. Johnstone 56

Lanthanum; Action of bromine on ——. Browning 691
from a physiological-chemical standpoint. Bokorny 888

Lanthanum oxide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
salts; Bactericidal and antitoxic action of —— on the cholera vibrio. Frouin and Roudsky 942

Lard; Detection of beef fat in ——. Bömer 323
Detection of beef and mutton fats in ——. Bömer 38
Detection of beef and mutton fats in —— by Bömer's method. Sprinkmeyer and Diedrichs 563
Detection of —— in coconut oil, butter fat, and goose fat. Bömer 323
substitute; Apparatus for making ——. (P) Chisholm, and Chisholm Process Oil Refining Co. 1062
substitute; Manufacture of ——. (P) Chisholm, and Chisholm Process Oil Refining Co. 1168

Larkspur seed; Insecticidal value of fluid extract of ——. Williams 1169

Latex; Treatment of ——. (P) Davidson 758
See also under Rubber.

Lavender oil. *See under* Oils, essential.

Leaching experiments; Laboratory apparatus for ——. Balderston and Alsop 1163

Lead : Alleged separation of radium D from radioactive —— by Grignard's reaction. Staehling 75
  anodes for electrolytic purposes ; Antimonial ——. (P) Siemens und Halske A.-G. 322
  -antimony alloys ; Determination of antimony and arsenic in ——. Bertiaux 262
  Apparatus for refining and desilverising ——. (P) Thum 969
  -arsenic alloys ; Solidification diagram of ——. Heike 553
  in bismuth subnitrate ; Detection of ——. Guérin 748
  Brittleness of ——. Bauer 317
  in the ceramic industry ; Problem of ——. Petrik 80
  chambers. *See under* Sulphuric acid.
  -coated sheets ; Method of sampling and analysing ——. Aupperle 1212
  -copper-nickel alloys ; Ternary ——. Parravano 1212
  Corrosion of ——. Gaines 1094
  Determination of small quantities of ——. Siegfried and Pozzi 504
  Determination of —— volumetrically in ores. Alder and Coolbaugh 595
  in drinking water ; Colorimetric determination of ——. Reese and Drost 661
  Electrodeposition of ——. Mathers and Cockrum 1158
  and the end product of thorium. Holmes and Lawson 1206
  Extraction of —— from complex sulphide ores. (P) Fiévet.. 321
  Highly sensitive reaction for ——. Iwanow 435
  matte converting at Tooele, Utah. Kuchs 967
  in official substances and preparations ; Limits of ——. British Pharmacopœia 982
  ores ; Extraction of rare metals and radioactive metals from —— and production of a white pigment. (P) Deutsche Felsen Oel Ges. 871*r*
  ores ; Preparation of very finely divided —— for an oil-flotation process. (P) Wolf 793
  ores ; Separation of rare metals from —— and production of sublimed white lead. (P) Deutsche Felsen Oel Ges. Franzen und Co. 31*r*
  ores ; Smelting —— in the blast-furnace. Palmer 1158
  ores ; Treatment of ——. (P) Bensusan 30
  poisoning caused by a water supply. Neisser 1168
  poisoning ; Value and importance for the German lead industry of blood examination in ——. Schoenfeld 709
  Pumping apparatus for making long pipes, etc., from molten ——. (P) Debauge 320, 425, 598
  Sensitiveness of some reagents for ——. Eegriwe 891
  Separation of —— from sulphide or oxide ores, etc., containing copper and zinc. (P) Borchers and Menzel 870
  service-pipes ; Action of water on ——. Liverseege and Knapp 158
  silver-zinc alloys ; Ternary ——. Bogitch 1092
  silver-zinc ores ; Treatment of —— by smelting with zinc salts. (P) Langguth........................... 698
  smelters in Germany ; Working and health conditions of —— 1169
  smelting ; Use of the bag-house in ——. Anderson 967
  Solid, thick deposits of —— from lead acetate solutions. Mathers 358
  sulphide ; Separation of —— from ores. (P) Minerals Separation, Ltd. 320
  sulphide and zinc sulphide ; Method of separating ——. (P) Bradford...................................... 319
  from tin and antimony ; Use of hydrofluoric acid in the separation of —— by means of electric current. McCay 1117
  in tinning baths and solders ; Determination of small quantities of ——. Breteau and Fleury 1012
  and the war 1057
  World's production of —— 833
  workers ; Industrial diseases among ——. Grempe.... 1094
  -zinc ores ; Apparatus for treating ——. (P) Isherwood 793
  -zinc sulphides ; Treatment of —— by the Horwood process. Horwood 203
Lead acetate, lead oxide, water ; Equilibrium in the system ——. Jackson.............................. 1046
  arsenate, lime, and sulphur spray ; Chemical studies on the ——. Ruth 159
  arsenate ; Manufacture of —— :
    (P) Barstow, and Dow Chemical Co. 789
    (P) Dow and others 789
  arsenates. Tartar and Robinson 1008
  carbonate ; Nature of basic ——. Euston 603
  chloride and potassium chloride ; Equilibrium between —— in aqueous solutions. Demassieux 254
  chloride and sodium chloride ; Equilibrium between —— in aqueous solution. Demassieux 351
  nitrate solutions ; Process for producing ——. (P) Anderson and Kaar 200
  orthoplumbate ; Preparation of pure ——. Milbauer .. 703
  oxide ; Production of —— and apparatus therefor. (P) Innes 604
  oxide ; Reduction of ——. Sabatier and Espil 1092
  oxides ; Determination of the higher —— by iodometry. Milbauer and Pivnicka 591
  peroxide ; Determination of —— by the Lux method. Ipiens 420
  pigments ; Analysis of white and red ——. Reports of Committee of Amer. Soc. for Testing Materials 1019, 1019
  pigments ; Manufacture of ——. (P) Holley, and Acme White Lead and Color Works 149
  red ; Analysis and composition of ——. West 652

Leather ; Adhesives or cements for ——. (P) "Ago" Lederkitt Industrie 153*r*
  analysis ; Revised method for determining glucose in —— 209
  artificial : Manufacture of ——. (P) Lilienfeld 432*r*
  Bleaching of sole ——. Sprague 1164
  Cleaning goods made of washable ——. (P) Karplus und Herzberger 365, 932*r*
  Conversion of —— into substances similar to horn. (P) Damgaard and Rasmussen 432
  Conversion of waste —— into ammonia and combustible gases. (P) Smith 472
  Definition of adulterated or loaded ——. Union of South Africa 759
  Detection of cellulose extracts in ——. Moeller 840
  Detection of free sulphuric acid in ——. Paessler 365
  Determination of the acidity of ——. Nicolardot 606
  Determination of dextrose in ——. Veitch and Rogers 1064
  finishing ; Uses of collodion in ——. Higgins 704
  Free sulphuric acid in —— :
    Moeller 95
    Paessler 95
  Growth of mould on harness ——. Seymour-Jones 493
  Impregnation and preservation of —— and leather goods. (P) Eitner and Kind 1021
  liming control ; Light ——. Wood 654
  Manufacture of —— :
    (P) Anhydat-Lederwerke 759
    (P) Röhm 1216
  Manufacture of chrome ——. (P) Anhydat-Lederwerke 759
  manufacture ; Disinfection of hides and skins in ——. (P) Röhn 153*r*
  Manufacture of formaldehyde ——. (P) Evler 655
  Manufacture of —— or leather products. (P) Spalteholz and Hariog 95*r*
  Manufacture of packing for machinery from ——. (P) L'Air Liquide Soc. Anon. 241
  Method of subjecting lacquered —— to the light treatment. (P) Junghans 759*r*
  Preparation of multi-coloured, figured ——. (P) Wolff 269
  Preparation of a non-slip, waterproof, chrome ——. (P) Allen.. 1064
  Preparation of washable upholstery ——. Ritter 1064
  preservative ; Manufacture of a ——. (P) Darling 1164
  Process for colouring artificial ——. (P) Girzik 559
  Process for decolorising ——. (P) Friedrich 840
  Process for drying varnished or japanned —— :
    (P) Genthe 95, 606*r*
    (P) Heyl 269*r*
  Process for graining and waterproofing split, inferior, and weak ——. (P) Krug and Böllert 559
  Relation between the "feel" of —— and its appearance under the microscope. Innes 579
  scrap ; Conversion of —— into substances similar to leather :
    (P) Damgaard 655*r*
    (P) Damgaard and Rasmussen 432
  scrap ; Manufacture of a solid, elastic mass from ——. (P) Kraitscher, and "Veto Company" 431
  shavings or cuttings ; Manufacture of fertiliser from ——. (P) Moise............................... 494*r*
  Standard forms for reporting analyses of ——. Alsop .. 1164
  substances ; Manufacture of ——. (P) Rössler...... 559
  Sulphuric acid in ——. Thuau and Madru 840
  Treatment of —— with alginates made from seaweed. (P) Ingham 689
  Treatment of chrome —— to render it strong and waterproof. (P) Walter 654
  Treatment of iron-tanned ——. (P) Bystron and von Vietinghoff................................... 209*r*
  Treatment of —— with liquids. (P) Loschkareff 365
  Treatment of —— to render it waterproof and nonslipping. (P) McLennan 95, 269*r*
  Treatment of —— for waterproofing and other purposes. (P) Matthews 327
  waste ; Production of an artificial manure from ——. (P) Moise.................................... 366*r*
  waste : Production of nitrogenous and phosphatic fertilisers from ——. (P) Leblanc, Ledoyen et Cie. 494
Lecithin preparation obtained by treating egg yolk with acetone ; Purification of the ——. (P) Fendler .. 568
Lecithin salts ; Preparation of ——. (P) Bergell 220

  resembling normal daylight; Production of white ——. (P) Grosheintz 686
  source; New standard ——. Jones 1107
  Supposed chemical changes by the action of ——. Sernagiotto and Hoschek 567
  Syntheses in organic chemistry by means of ——. Paternò 982
Lighting flames; Quantity of carbon monoxide and nitric oxide in ——. Terres 825
  Gas —— and hygiene. Von Grüber 1149
  in Japan; Gas and electric ——. Inibushi 1149
Ligneous materials; Injection and re-agglomeration of ——. (P) Blavinhac 27
  materials; Treatment of ——. (P) Strong 954
Lignite briquettes; Rhenish —— in domestic and industrial use. Oellerich 1082
  Briquetting —— by means of a mixture of pitch and tar oils. (P) Moreau 635
  Distillation of ——, and utilising the products for creosoting timber, etc. (P) De Nagy 686
  Production of acetic acid and alcohol from ——. (P) Behrens 807
  Regenerative oven for carbonising —— and recovering by-products. (P) Guardabassi and Goulliard 473
  sludge: Filters for ——. (P) Ribbertsche Braunkohlen-, Brikett-, u. Tonwerke 14
  Treatment of ——. (P) Rigby and Testrup 952
Lignocellulose. Cross 1201
  Apparatus for treating —— with steam and hydrolysing agents. (P) Tomlinson 132r
  Bleaching ——. (P) De Vains and Peterson 746r, 916r
Lignocelluloses; Recovery of volatile acids, methyl compounds, and furfuran bodies from hydrolysed ——. (P) Lederer and Lederer 478
Lignum vitæ sawdust; Utilisation of ——. (P) Forshaw .. 1197
Lime; Action of —— in the nutrition of plants. Haselhoff 760
  Apparatus for slaking —— with sugar juice or water. (P) Eberhardt Maschinen- und Armaturenfabrik 127, 302
  -arsenic paints; Practical observations in the preparation of ——. Innes 578
  from causticising operations; Recovery of the spent ——. Payne 1153
  from causticising plant; Composition and agricultural value of carbonate of ——. Hendrick 122
  in cyaniding; Use of ——. Merton 202
  Hydrated —— for cyaniding. Meade 833
  kilns. (P) Crosland and Booth 833
  liquors: Determination of alkali sulphides in ——. McCandlish and Wilson 606
  liquors; Determination of sulphides in ——. Blockey and Mehd 269
  Manufacture of cement from spent or waste ——. (P) Illeman 922
  Manufacture of hydraulic —— from sulphate of lime. (P) Basset 922r, 964, 965r
  Manufacture of quick- —— in blocks:
    (P) Negro and Neumerkel 260
    (P) Neumerkel 353r
  Manufacture of a substance which increases the hydraulic properties of ——. (P) Alpine Maschinenfabriksges., and Meyer 964
  Manurial experiments with ——. Bolin 1101
  in ores and slags; Determination of ——. Blum 359
  Process for continuous slaking of —— with sugar juice or water. (P) Eberhardt 127
  Relative effect of —— on certain soils as oxide and carbonate. Hutchinson and MacLennan 1065
  requirement of soils; Determination of the ——:
    Bizzell and Lyon 34
    Hutchinson and McLennan 932
    Moulton and Trowbridge 1066
  rich in hydrated silica as a fertiliser. Immendorff 1165
  and sand: Apparatus for hydrating mixtures of ——. (P) Sutcliffe 27r
  sulphur, and lead arsenate spray; Chemical studies on the ——. Ruth 159
  -sulphur-salt wash; Composition of the ——. Haywood 99
  -sulphur sprays; Preparation and composition of ——. Ramsay 662
  for viticulture, agriculture, and building; Manufacture of fat ——. (P) Filleux 655
  water; Apparatus for preparing —— for use in treating water. (P) Anderson 331
Lime-juice: Nitrogenous constituents of ——. Funk 664
Limestone; Manufacture of magnesium carbonate from magnesian ——. (P) Young 830
  Manufacture of synthetic ——. (P) Venturi 315
Limestone Island. New Zealand; Portland cement manufacture at ——. Rhodes 201

PAGE
Limonene; Conversion of —— into carvomenthene and menthane. Vavon 374
Linalool; Constitution of ——. Barbier and Locquin 711
Linen; Characters of the fatty substances of ——. Bianchi and Malatesta 602
  goods; Oxycellulose in ——. Saget 1151
  Machine for dyeing —— with vat or sulphide dyestuffs. (P) Kaufmann 118
  Manufacture of soap for use in dressing ——. (P) Weiss 603
  Process for transferring pictures to ——. (P) Christiansen 547
Lining tanks and reservoirs; Process for ——. (P) Comp. du Ciment-Verre 951
Linoleum manufacture; Use of Para rubber seed oil for ——. Fritz 33
  Production of varnish for use in making ——. (P) Girzik 973
Linolic tetrabromide ethyl ester as a product in the analysis of cottonseed oil. Palmer and Wright 1061
Linoxyn; Characters of ——. Fritz and Zymandl 429
Linseed oil. *See under* Oils, fatty.
  Rate of liberation of hydrocyanic acid from ——. Collins and Blair 273
Lipase; Action of radium emanation on ——. Marshall and Rowntree 32
  of castor oil seeds; Activity of —— at low temperatures. Blanchet 428
  of *Chelidonium* seeds. Bournot 797
  Correlation of the synthetic and hydrolytic activity of ——. Armstrong and Gosney 929
Lipoids of milk-separator slime; The ——, and their importance in the formation of milk fat. Laxa and Konecny 214
Liquefying air and separating it into its constituents; Process and apparatus for ——. (P) Jaubert 645
  constituents of gaseous mixtures by compression and cooling. (P) Hirschlaff 137
  gas mixtures and separating the constituents; Processes for ——. (P) Mewes 583r
Liqueurs; Process of clarifying, ageing, and refining ——. (P) Monti 979r
Liquid; Apparatus for introducing one —— into another under pressure. Parsons 949
  films; Apparatus for treating ——. (P) Boys 343r
  -interferometer; Use of the —— in the examination of water. Marc and Sack 564
  mixtures; Rapid method of measuring the partial pressures of ——. Rosanoff and others 1027
  Process and apparatus for determining by weight quantities of ——. (P) Hartung 539
  Recovery of the separating —— from separated solids. (P) Du Pont and others 65r
  suspensions; Separation of ——:
    (P) Comp. Franç. pour l'Exploit. des Procédés Thomson-Houston 908r
    (P) General Electric Co. 780
Liquids; Agitation of —— by compressed air or liquid under pressure. (P) Dampfkessel u. Gasometerfabr., and Deuts. Teerproduktenvereinigung Ges. 14
  Apparatus for aerating and gasifying ——. (P) Irwin 274, 274, 823r
  Apparatus for agitating and aerating ——. (P) Howard, and Minerals Separation, Ltd. 127r
  Apparatus for clarifying ——:
    (P) Lowden, and Colorado Iron Works Co. 780
    (P) Reid 1170
  Apparatus for the continuous examination of ——. (P) Friese and others 669r
  Apparatus for desiccating ——. (P) Gray and Jensen .. 13
  Apparatus for the even distribution of ——. (P) Jonas, and Bayer und Co. 1081r
  Apparatus for filtering, removing gases from, or distilling ——. (P) Kirschner 302
  Apparatus for measuring ——. (P) Liese 340
  Apparatus for mixing ——. (P) Goldman 950
  Apparatus for purifying ——. (P) Linden 938
  Apparatus for purifying —— by aeration. (P) Jones, and Jones and Attwood, Ltd. 1170
  Apparatus for raising ——. (P) Paindavoine 341
  Apparatus for sampling ——. (P) Chambers 714
  Apparatus for scrubbing or similarly treating ——. (P) Sewell 999
  Apparatus for separating —— from elastic fluids. (P) Woollard, and Brotherhood, Ltd. 583
  apparatus for separating fibres and the like from ——. (P) Chambers and Hammond 14r
  Apparatus for separating fibrous and other solid matter from ——. (P) Hofer 939, 951r
  Apparatus for separating lighter —— from a mixture of liquids. (P) Lorenzen 14
  Apparatus for separating solid substances from ——. (P) Hencke 302
  Apparatus for separating suspended impurities from ——. (P) Pfaul 632
  Apparatus for spraying —— and mixing them with gases or vapours. (P) Salzbergwerk Neu-Stassfurt ...... 18[illegible]

- Apparatus for treating waste ——. (P) Irwin 565
- Appliances for spraying or atomising —— by air or gases. (P) Samuelson and Backhouse 631
- Application of —— to cylindrical drying machines. (P) Sticler 188*r*
- Automatic apparatus for raising and forcing ——. (P) Brown 13
- Automatically controlling the proportionate admixture of two or more ——. (P) Bramwell 999
- Centrifugal apparatus for clarifying ——. (P) Sloan and Barnes 500*r*
- Centrifugal drum separators for ——. (P) Melotte 1218
- Chemical treatment of large quantities of ——. (P) Lassen and Hjort 662
- Condensation or concentration of —— by filtration. (P) Kuhn 99*r*
- containing colloidal silicic acid; Purification of ——. (P) De Stucklé 645
- containing dissolved or suspended matter; Destructive distillation of ——. (P) Rinman 346
- containing fatty globules; Process and apparatus for sterilising ——. (P) Nielsen 882, 1110*r*
- containing suspended matter; Centrifugal apparatus for purifying ——. (P) Fearnley and Geen 478
- Conveying inflammable ——. (P) Martini u. Hüneke Maschinenbau A.-G. 64, 64
- Desiccation of —— and apparatus therefor. (P) Töpfer 63
- Desiccation of aqueous animal or vegetable ——. (P) Niegovan 823
- Determination of the density of ——. (P) Kalähne 163
- of different densities; Apparatus for separating ——. (P) Kelly 907
- Electrochemical treatment of —— and apparatus therefor. (P) Landreth 971
- Elevation of —— and apparatus therefor. (P) Priestman 884
- Extraction of solids suspended in —— in the form of mud. (P) Hertenbein 540
- and gases; Apparatus for effecting intimate contact of ——. (P) Kirkham, Hulett, and Chandler, Ltd., and others 341
- and gases; Automatic regulation of apparatus for mixing ——. (P) Noll 469
- Heating of ——. (P) Kirke, and Bonecourt Surface Combustion, Ltd. 736
- Manufacture of metallic vessels for transporting and storing ——. (P) Held 470
- Means for collecting and discharging solid matter when pumping ——. (P) Pennell and Orten-Boving 1221
- Method of clearing —— and apparatus therefor. (P) Curtis and Huxley 707
- Method of homogenising ——. (P) Berberich.. 302, 469, 737
- Method of separating foreign matter from waste ——. (P) Loebel 565
- Oxidation and separation of iron in ——. (P) Bayerische A.-G. f. Chemische u. Landwithschaftlich-Chemische Fabrikate, and others 313*r*
- Pasteurisation of ——, and apparatus therefor. (P) Krug 710
- Pasteurising, sterilising, and cooling ——. (P) Gregory 1105
- Preparation of "crystallised" ——. (P) Wegener 157, 214*r*
- Process for drying ——. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab 643
- Process for mixing —— and rendering them homogeneous. (P) Berberich 469
- Process for obtaining solids from ——. (P) Merrell, and Merrell-Soule Co. 850
- Process for purifying, clarifying, or decolorising ——. (P) Marcus 188
- Process for removing iron from ——. (P) Hackl and Bunzel 750*r*
- Process for rendering —— radioactive. (P) Landin 864
- Process for separating mixtures of ——. (P) Golodetz and Benedix 14
- Process for submitting —— to the action of ultra-violet rays. (P) De Kowalski-Wiernsz 981
- Protection of closed vessels in which inflammable —— are used. (P) Martini und Hüneke Maschinenbau A.-G., and Güngerich 13
- Pumping or raising —— and apparatus therefor. (P) Mellis 408
- Purification of ——:
  - (P) Janvier et Cie. 1169
  - (P) Leavitt 372, 842*r*
  - (P) Linden 938
  - (P) McKee 100*r*
- Purification and decolorisation of ——. (P) Tiemann 155, 271*r*
- Purification and sterilisation of ——. (P) Swinburne, and Sterilisation Co. 39
- Purification of waste ——. (P) Richter und Richter .. 663

Liquids—*cont.*
- Raising and forcing —— and apparatus therefor:
  - (P) Humphrey and Rusdell 998
  - (P) Joy 341
- Separation of gases from ——. (P) Strohbach, and General Electric Co. 633
- Separation of impurities from —— by centrifugal force. (P) Hamill 407
- Separation of solid substances from ——. (P) Hencke 302
- Separation of suspended solids from —— and apparatus therefor. (P) Jarraud 65
- from solids; Apparatus for separating ——. (P) Colburn 1081
- and solids; Centrifugal treatment of mixtures of ——. (P) Bromet and others 1111
- and solids: Process for separating —— and washing the solids. (P) Berrigan and others 342
- Sterilisation of ——:
  - (P) Edwards 372
  - (P) Henri and others 500
- Sterilisation of —— by ultra-violet rays. (P) Donilhet 981
- Sterilisation of —— by means of ultra-violet rays in vacuum tubes. (P) Scheidt 663
- Sterilising and purifying fermented ——. (P) Shelmerdine and Lewis 37
- Storage of inflammable ——. (P) Martini u. Hüneke Maschinenbau A.-G. 64
- suspended or combined in gases or fumes; Extraction of ——. (P) Armstrong— 186
- System for cleaning and purifying ——. (P) Johnson, and Bowser and Co. 1192
- System for ozonising ——. (P) Butler, and American Ozone Co. 500
- System for treating —— with ozone. (P) Fuss, and General Electric Co. 373*r*
- in tanks; Apparatus for sampling ——. Schmitz 905
- Treatment of ——:
  - (P) Fox and others 1168
  - (P) Tait 564
- Treatment of —— to improve their quality. (P) Henry 979*r*
- Treatment of —— by nascent ozone. (P) Breydel 556

Liquor calcis sulphuratae (Vleminckx's solution); Preparation and analysis of ——. Mayer 942

Liquorice powder; Composition and analysis of compound ——. Parkes and Major 501

Litharge; Process and apparatus for making ——. (P) Barthelmess 593

Lithgow, New South Wales; Electrolytic refining of auriferous and argentiferous copper at ——. Blakemore 202

Lithium nitrite. Ball and Abram 75

Lithographic stone; Manufacture of artificial ——. (P) Hereng 82, 647

Lixiviating beetroot slices and other subdivided material; Apparatus for ——. (P) Möhring 841
- ores and other material; Apparatus for ——. (P) Robinson 87
- wool; Pumps for use in ——. (P) Bernhardt 197

Loading materials for paper; Behaviour of —— to dyestuffs. Von Ehrenthal 858

Loam soils; Distribution of certain constituents in the separates of ——. Steinkoenig 799

Lobsters; Process for preserving ——. (P) Danilevsky 371

Locust beans; Manufacture of gum or mucilage from ——. (P) Piocl 879*r*

Logwood black; Production of —— by direct oxidation, on silk, wool, or cotton. Romann 309

Lokas dyestuff (Chinese green). Rüdiger 742

London waters; Chemical and bacteriological examination of ——. Houston. Metropolitan Water Board Report 979

Longleaf pine (*P. palustris*); The leaf oil, twig oil, and cone oil of the ——. Schorger 983
- for paper pulp; Suitability of ——. Surface and Cooper 857

Lophantus rugosus; The essential oil of ——. De Vilmorin and Levallois 436

Louisiana cane juices; Sulphitation and carbonatation processes for clarifying ——. Cross 656

Low-freezing liquid. (P) Hunter 219

Lubricant. (P) Simpson 412
- grease. (P) Mariner, and Pensacola Tar and Turpentine Co. 1002
- Talc as a ——. Thalberg 702

Lubricants; Apparatus for testing ——. (P) Drosten 846
- Manufacture of ——. (P) Fresenius 740
- Manufacture of —— and substances for adding thereto to indicate hot-running. (P) Esch 839
- Standard tests of ——. Report of Committee of American Society for Testing Materials 1018

Lubricating grease which may be used to prevent and remove incrustations in steam boilers. (P) Oliveras 148
- greases; Manufacture of ——:
  - (P) Chem. Fabr. Troisdorf Dr. Hülsberg und Seiler 90, 603*r*
  - (P) Schmitt 838
- oil; Repeated use of —— after filtration. Fenno 582
- oils; Machine for testing —— at any temperature and with different metals. Schmitz 872

PAGE

- Lubricating—*cont.*
  - oils for motors; Testing ——. Lumet 242
  - properties of oils and greases; Machines for testing the ——. (P) Hislop 90
- Lubrication with oils and with colloidal graphite; Comparative tests of ——. Mabery 1079
  - Utilisation of used oils for ——. Pellet 266
- Lumber; Treatment of ——. (P) Gilliam 201
- Luminous composition. (P) Karr and Flannery 1162
- Lygosine (dihydroxydibenzalacetone) as a new indicator. Ferencz 1075

M

- *Mabula pansa* seeds and oil. Wagner and Muesmann 1098
- Macadam; Bitumen ——. (P) Ingham 26
  - road construction; Part played by water in ——. Fearnsides 26
- Machine grease; Manufacture of ——. (P) Schmitt 838
- Machinery; Packing for ——. (P) L'Air Liquide Soc. Anon. 241
- Madagascar; Cultivation of vanilla in ——. Fauchère 611
  - Silk in —— 1045
  - Value of the cinchona trees grown in ——. Perrot and Huber 804
- Madder extract "Meissonier"; Manufacture of ——. Bell 475
- Magnesia; Action of —— in the nutrition of plants. Haselhoff 760
  - Fertilisation of the sugar beet with ——. Strohmer and Fallada 1216
  - in magnesites; Determination of ——. Wdowiszewski 863
  - in ores and slags; Determination of ——. Blum 359
  - -Portland cement and its properties. Von Glasenapp.. 694
  - Rôle of —— in the carbonatation process of making white sugars. Harloff 154
  - in the sugar carbonatation process; Rôle of ——. Pellet 271
- Magnesite brick or calcined magnesite; Effect of steam on ——. Youngman 1053
  - Determination of magnesia in ——. Wdowiszewski .. 863
  - discovery in South Australia 591
  - Manufacture of sintered ——. (P) Pohl 922
- Magnesium-aluminium alloys; Supplement to the phase diagram of ——. Schirmeister 1159
  - and calcium; Analytical separation of ——. Halla .. 161
  - in calcium salts; Determination of ——. Hostetter .. 591
  - Determination of —— by physico-chemical volumetric methods. Application to the analysis of wines. Duboux 1105
  - iron alloys; Electrolytic separation of —— from aqueous solution. Kremann and Lorber 792
  - Manufacture of ——. (P) Wallace and Wassmer 490*r*
- Magnesium boride. Ray 1008
  - -calcium carbonate in a voluminous form; Production of ——. (P) Bindschedler 136
  - carbonate, carbonic acid, water, and magnesium carbonate, calcium carbonate, carbonic acid, water; The systems ——. Leather and Sen 1007
  - carbonate; Manufacture of basic ——:
    - (P) Chem. Fabr. Rähnitz 200
    - (P) Silbermann 788
  - carbonate; Manufacture of —— from magnesian limestone. (P) Young 830
  - cement; Manufacture of ——. (P) Siegmann and Gault 1089
  - chloride; Effect of —— on the oxidising action of chlorates and nitrates. Hofmann and others 742
  - chloride as a mineraliser. Hofmann and Höschele 199
  - chloride; Process for producing ——. (P) Graves and Schaefer 484
  - glycerophosphate of commerce; Composition of ——. Umney and Bennett 844
  - oxide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  - oxide from the waste lyes of the manufacture of potash salts; Manufacture of hydrochloric acid and ——. (P) Dietz 1009
  - perborate; Manufacture of ——. (P) Henkel und Co. 961, 962*r*
  - perchlorate. Weinland and Ensgraber 74
  - salts; Action of —— on complex compounds of aluminium, iron, and bismuth with organic substances. Quartaroli 591
  - salts of acylated aromatic o-hydroxycarboxylic acids. (P) Berendes and others 1226
  - sulphate; Commercial standards for dried ——. Umney and Bennett 829
  - sulphate; Manufacture of ——. (P) Clarke, and Ohio Chemical and Manufacturing Co. 1088
  - sulphate from residues of potash-salt manufacture containing kieserite; Manufacture of ——. (P) Heintz Tech. Buro f. d. Chem. Ind. 1154
  - sulphate in saffron; Detection of ——. Nestler 501

- Magnetism of certain chrome and tungsten steels; Permanent ——. Moir 1091
- Magnetite in mattes and slags. Bennio 83
- Mahone petroleum and its recent origin. Mabery 242
- Maize kernel; Nutritive properties of the proteins of the ——. Osborne and Mendel 708
  - Manufacture of sucrose from ——. Bohle 704
  - Phytin in ——. Anderson 371
  - Treatment of —— in the distillery by means of enzymes to recover oil. Vasseux 707
- *Malachra capitata* fibre from India 476
- Malic acid; Reaction of ——. De Coninck 160
  - salts of the rare earths. Jantsch 863
- Malt analysis; New German standards for ——. Bode and Wlokka 801
  - Apparatus for producing ——. (P) Chichester 1217*r*
  - beverages; Pasteuriser for ——. (P) Erikson 497
  - coffee. Doepmann 498
  - Determination of amino-acid and polypeptide nitrogen in ——. Adler 367
  - extract; Determination of ——. Dreaper 786
  - extract; Laboratory studies on ——. Graber 612
  - extracts; Determination of the diastatic power of ——. Monnier 271
  - extracts; Removal of the bitter taste and burnt smell from ——:
    - (P) Cantor 659, 936*r*
    - (P) Weyermann 882*r*
  - flour for baking purposes; Preparation of ——. (P) Hatt frères 882
  - food preparations:
    - (P) Hoffmann and Meerwein 660
    - (P) Hoffmann-La Roche und Co. 883*r*
  - Formation of colour and aroma in curing ——. Langer 271
  - Influence of dilution of mash on yield of extract found in examination of —— by the Congress method. Windisch and Glaubitz 97
  - Machine for withering, drying, and curing ——. (P) Sleeman 1166
  - Purchase of —— on the basis of analysis. Heron and Heron 1103
  - Treatment of grain in the production of ——. (P) Chichester 37*r*
  - wines and their relation to the German law. Kulisch.. 212
  - worts; Temperature corrections for the specific gravity of ——. Day and Amos 434
- Maltase; Action of —— on α-methylglucoside. Rona and Michaelis 37
  - of beer yeast; Affinity constant of ——. Rona and Michaelis 37
  - of beer yeast; Conditions of activity of ——. Michaelis and Rona 272, 368
  - Influence of acids on the activity of dialysed ——. Kopaczewski 368
  - of zymin and dried yeast. Harden and Zilva 761
- Malting drums; Apparatus for producing and controlling moistened air in ——. (P) Topf 936
  - grain; machine for ——. (P) Sleeman 1166
  - machine. (P) Sleeman 842
- Maltose; Action of cold concentrated hydrochloric acid on ——. Velocity of hydrolysis. Daish 934
  - Action of dilute solutions of barium and other hydroxides on ——. Kolb 657
  - Assimilation of —— by yeasts. Kita 1104
  - Determination of —— by means of neutral sodium hypoiodite. Bland and Lloyd 949
  - and glycerophosphoric acid; Preparation of a stable crystalline compound of ——. (P) Jacoby 43
  - Preparation of ——. (P) Duryea 1023
  - Structure of —— and its oxidation products with alkaline hydrogen peroxide. Lewis and Buckborough 1102
- *iso*-Maltose; Synthetic ——. Von Friedrichs 328
- Mammoth pump; Use of the —— in chemical industry. Meerbach 301
  - pumps for mixing and conveying slurry. Steen 866
- Manganese in alloy steels; Determination of ——. U.S. Bureau of Standards 140
  - alloys; Use of slags from the electric furnace manufacture of —— for making Portland cement. (P) Viélajus 422
  - Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  - -brass, manganese-bronze, and similar alloys; Manufacture of ——. (P) Heusler, and British Mining and Metal Co., Ltd. 205
  - -copper-nickel alloys; Electrical resistance and temperature coefficient of ——. Gray 792

  ores; Use of —— in contact processes. (P) Messerschmitt 201
  phosphides; The higher ——. Hilpert 351
  reaction; Study of Marshall's ——. Schowalter 570
  in soils; Action of ——. Skinner and others 560
  -steel ingots; Treatment of ——. (P) Osborne 597
  -steel; Magnetic and mechanical properties of ——. Hadfield and Hopkinson 552
  -steel; Manufacture of ——:
    (P) Campbell and others 1095
    (P) Nichols 792
  -steel; Method of forming machined shapes of ——. (P) Potter 29
  in varnishes; Detection of ——. Malatesta and di Nola 798
  in water; Colorimetric determination of small quantities of ——. Lührig 709
  in water; Detection and determination of ——. Tillmans and Mildner 709
  from water; Removal of ——. Tillmans 883
Manganese and bromine; Combination of —— in presence of ether. Ducelliez and Raynaud 310
  chloride with ammonium chloride; Mixed crystals of ——. Foote and Saxton 918
  compounds; Action of —— on the cultivation of the sugar beet. Pellet 153
  oxide; Use of —— for the catalysis of acids. Sabatier and Mailhe 437, 501
  peroxide; Manufacture of anodes of massive ——. (P) Siemens und Halske A.-G., and Huth 871
  salts; Influence of —— on the growth of plants. Pfeiffer and Blanck 1101
  salts from water; Removal of ——. Tillmans and Heublein 331
  sulphide. Villiers 808
  sulphide; Heat of formation of ——. Wologdine and Penkiewitsch 1046
Manganites; Synthesis of ——. Pukall 863
Manganous arsenate jellies; Preparation and properties of ——. Deiss 420
  oxide and carbide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
Mangrove; Detection of ——. Reed and Schubert 558
  Determination of —— in admixture with other tanning materials. Kerr 152
  extract; Application of tungsten salts to the analysis of ——. Hough 847
  extracts; Determination of pentoses in ——. Van Gijn and van der Waerden 151
  in quebracho extracts; Detection of —— by van Gijn and van der Waerden's method. Moeller 839
Manihot rubber. Weber 605
Manihot Glaziorii seeds; Oil from ——. Sprinkmeyer and Diedrichs 322
  Yield of rubber from ——. Fickendey 267
Manketti nuts; Oil of ——. Sprinkmeyer and Diedrichs 1097
Mannite from natural musts; Process for making ——. (P) Guignard 497*r*
Mannitol from lævulose; Production of —— by hydrogenation. (P) Lupieri and Mayer 977
  Methods for the quantitative determination of ——. Smit 769, 808
d-Mannose; Conversion of *d*-glucosamine into ——. Irvine and Hynd 433
Manure; Process for producing efficient fermentation of ——. (P) Beccari 933, 933*r*
  See also Fertilisers.
Manuring experiments in India; Green ——. Hutchinson and Milligan 933
Maple products; Analysis of ——. Comparative study of the delicacy of methods. Snell and Scott 154
  sap products and the Canadian standards. Snell 507
  sugar evaporator. (P) Ober and Ober 1068
  sugar sand; Composition of ——. Snell and Lochhead 495
  syrups; Range of variation of analytical values in genuine ——. Snell and Scott 367
Marble, artificial; Manufacture of ——. (P) Douzal 647
  artificial; Manufacture of —— from leather. (P) Heuschkel 551*r*
  plates; Process for increasing the translucency of thin ——. (P) Engel 137
Marcs; Process for ageing —— artificially by radioactivity. (P) Farjas 978
  Treatment of —— to recover the tartrates. (P) Arrivaut and Teyssier 882
Margarine; The butter-fat content of ——. Arnold 1106
  Manufacture of ——:
    (P) Blichfeldt 1167, 1218, 1218
    (P) Schou 215, 883

  pots; Means for stirring or agitating molten metal in ——. (P) Hall 835
  yellow brass; Use of producer-gas for ——. Guenther 966
Menhaden oil; Constants of ——. Lund 756
Menthane; Conversion of limonene into ——. Vavon 374
Menthol and formaldehyde; Medicinal preparations containing ——. (P) Buchwald 276
  -thymol emulsoid in glycerin; A new ——. Don 665
Mercaptals of aldoses; Properties of some ——. Votocek and Vesely 607
Mercaptanostearic acid. Eckert and Halla................ 41
Mercerisation; Cleansing the lye used in —— from size and other organic substances. (P) Matter 689
  as judged by the action of caustic soda on regenerated cellulose. Beadle and Stevens 785
Mercerising machine for yarn. (P) Hahn 350*r*
  Process and apparatus for —— and for recovering the caustic soda. (P) Brächter 480, 860*r*
  Purification of caustic soda solutions used in ——. (P) Chambers and Hammond 418
  yarn; Machines for ——. (P) Hahn 641
Mercurammonium chloride; Constitution of white ——. Saha and Choudhury 351
Mercurial poisoning in 1913. Report of Inspector of Factories and Workshops 895
Mercuric acetate and aniline; Compound of ——. Vecchiotti 944
  benzoate. Rupp and Herrmann 888
  chloride; Process and apparatus for making ——. (P) Kaufler and Klages........................ 137*r*, 137*r*
  chloride; Volumetric determination of ——. Stüwe .. 891
  iodide and aniline; Equilibrium in the system ——. Pearce and Fry 1115
  iodide; Bactericidal power of ——. Stassano and Gompel 710
  iodide in tablets; Determination of ——. Bender .. 984
Mercurous chloride in tablets; Determination of ——. Marden and Cushman 1171
  sulphate; Commercial preparation of —— for normal cells. Warburg 700
Mercury; Determination of —— as metal. Duccini...... 162
  Determination of —— volumetrically. Clennell 1173
  Extraction of ——. (P) Szilard 321
  imports and exports; British ——. Pickering 85
  melting at the Royal Mint; Comparative cost of —— with coal-gas and coke fuel. Rigg 1157
  in mercury fulminate; Electrolytic determination of ——. Losanitsch 569
  ores; Wet process for the treatment of low-grade ——. Carrara 967
  recovery plant at Fresnillo, Mexico. Robinson 595
  in sulphuric acid; Determination of ——. Nisjenson .. 1086
  Volumetric determination of ——. Holmberg 45
  and the war.................................... 1056
  World's production of —— 833
Mercury compounds; Preparation of aromatic ——. (P) Meister, Lucius und Brüning 568, 767*r*
  compounds; Preparation of organic ——. (P) Schossberger and Friedrich 890
  compounds of the pyrazolone series; Preparation of ——. (P) Givaudan and Scheitlin 43, 43*r*
  -copper compounds; Basic ——. Finzi 135
  derivatives of cyclohexane. Grüttner 665
  fulminate; Electrolytic determination of mercury in ——. Losanitsch 569
  paranucleinate with alkalis; Preparation of compounds of ——. (P) Knoll und Co. 667
  paranucleinate with tannin; Preparation of compounds of ——. (P) Knoll und Co. 667
  salts; Preparation of solutions of —— in oils, fats, waxes, etc. (P) Gebr. Avenarius, and Wolff 604
  -substituted amino-compounds; Preparation of ——. (P) Dr. Bayer und Co. 220, 767
Mesothorium; Preparation of salts of —— from minerals containing thorium. (P) Deutsche Gasglühlicht A.-G., and others 789
  preparations and radium preparations of different ages; Distinguishing —— by aid of their γ-radiation. Hahn 643
  salts; Separation of —— in extraction of thorium salts from minerals. (P) Schwab 312
  Treatment of ores and intermediate products containing ——. (P) Ebler 864, 865*r*
  Treatment of sulphate mixtures containing ——. (P) Ebler 790
Mesua ferrea, L., from Assam; Oil seeds and oil from —— 147
Metal adsorptions; Process for producing ——. (P) Schwerin, and Ges. f. Elektro-Osmose 750*r*
  articles; Cleaning —— preparatory to applying enamel or the like. (P) Davidson 355
  articles; Compound ——. (P) Prescott 30
  articles; Electrolytic cleansing of ——. (P) Lévy 206
  articles of great strength and resistant to acids. (P) Pasel.................................... 697
  articles; Heating or annealing oxidisable —— in regenerative furnaces. (P) Siemens 144
  articles highly resistant to moist air, water, etc., but not acids. (P) Pasel 697
  bodies; Protection of —— against the action of nitrous fumes. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab 593
  and carbon; Manufacture of agglomerates of reduced ——. (P) Aarts 697
  coatings on flexible objects of organic origin; Production of ——. (P) Rafn and Schmidmer 747*r*
  colloids; Production of ——. (P) Crookes and Stroud 86, 1172*r*
  filaments for electric lamps; Manufacture of ——. (P) Lederer and others 1197*r*
  foil; Manufacture of coloured ——. (P) Genthiner Cartonpapierfabrik 869
  furnaces. (P) Hall 320, 361*r*, 425, 650*r* 1214*r*
  founding. (P) General Electric Co. 488, 490*r*
  ingots; Process and apparatus for casting ——. (P) Durville 699
  Means for stirring or agitating molten —— in melting pots. (P) Hall 835
  melting furnaces; Process for heating —— by liquid fuel. (P) Siegwart and Siegwart 342
  Method and apparatus for sintering ——. (P) Walling 425
  production in the United States 143
  sheets; Galvanising or coating ——. (P) Folland, Morris, and Griffiths.......................... 205
  spraying. Morcom 925
  surfaces; Cleaning ——. (P) Thompson 144*r*, 755*r*
  surfaces; Production of clean or deoxidised ——. (P) Hatfield and Yates 31*r*
  vapours; Process for recovering ——. (P) Helfenstein-Elektro-Ofen Ges. 969
  vessels; Treatment of the interior of ——. (P) Wicküler-Kupper Brauerei A.-G. 936
  and vitreous material; Production of gas-tight seals or closures between ——. (P) Sand and Reynolds .. 571
  wires; Process for drawing or alloying ——. (P) Wolfram Lampen A.-G. 1161
Metallic catalysts. (P) Wimmer and Higgins 426*r*
  coatings on cloth; Process for applying ——. (P) Worley and Greenwood 960
  coatings or deposits; Process and apparatus for applying —— to surfaces. (P) Morcom 968
  compounds; Gaseous ——. Von Wartenberg 1056
  eutectics; Growth of ——. Lamplough and Scott 968
  layers; Production of —— by projecting fused metal. (P) Soc. de Métallisation 88
  plates, sheets, etc.; Manufacture of compound ——. (P) Soc. Internationale de Métallurgie Nouvelle .. 426
  powders or coatings; Furnaces for producing ——. (P) Schoop 321*r*
  powders; Process for fixing —— on textile fibres. (P) Soc. de la Manuf. d'Indiennes E. Zundel 74*r*
  protective coatings; Rational test for ——. Capp 1213
  substances to be united by pressure; Preliminary treatment of ——. (P) Rônay, and General Briquetting Co. 360
  vessels for alcoholic fermentation and for transporting and storing liquid; Manufacture of ——. (P) Held 470
Metalliferous materials; Roasting, reduction, or other treatment of ——. (P) Timm 599
  materials; Treatment of ——. (P) Hovland and Frankforter 794
  products; Process of agglomerating fine ——. (P) Pretceille and others 650*r*
  sands or slimes; Treatment of ——. (P) Kendall 30
Metallising cellulose threads, films, or sheets; Process for ——. (P) Crumière et Cie. 480
  furnace. (P) Mathewson and Laist.................. 598
  the surface of cast iron, wood, gypsum, paper, etc.; Process of superficially ——. (P) Marino 650*r*
Metallurgical coke; Production of strong —— as free as possible from sulphur. (P) Franck 782
  furnace gases; Cooling —— before filtration. Anderson 925

Extraction of rare and radioactive —— from lead ores. (P) Deutsche Felsen Oel Ges. 871r
Extraction of useful —— from metallurgical slags. (P) Vuigner 206
Extraction of volatile ——. (P) Pape 321, 361r
Formation and application of alloys or mixtures of ——. (P) Morcom 1013
Furnace for the heat treatment of —— :
(P) Grebel 970
(P) Russell and Lord 1014
Furnace for obtaining easily oxidisable ——. (P) Zavelberg 700
Furnace for refining ——. (P) Wills 205
Furnaces for melting ——. (P) Ratcliff and Ratcliff 926
The hardening of ——. Edwards and Carpenter 552
The hardness of ——. Andrew 359
Hardness tests of ——. Relation between Brinell ball-test and scleroscope readings. Thomas 1213
Influence of allotropy on the metastability of ——. Cohen 1159
Influence of time in rapid deformations of ——. Charpy and Cornu 792
Internal strains in cold-wrought —— and some troubles caused thereby. Heyn 596
Interstrain theory of hardness of ——. McCance 1159
in malleable form ; Process and apparatus for producing ——. (P) Canello 321r
Manufacture of —— and apparatus therefor. (P) Bourcoud 264r, 792
Manufacture of articles of refractory ——. Opposition to grant of patent to Schwarzkopf and others 1016
Manufacture of bodies of refractory ——. (P) Schwarzkopf and others 650r
Manufacture of clad ——. (P) Monnot, and Duplex Metals Co. 1015, 1160
Manufacture of ductile bodies of high-fusing ——. (P) Liebmann and Hofheimer 1058
Means for ascertaining the hardness of ——. (P) Rudge-Whitworth, Ltd., and Heathcote 425
Melting —— by means of induced electric currents. (P) Guggenheim 426, 490r
Method of joining unlike ——. (P) Coolidge, and General Electric Co. 755r
Method of measuring the colour of ——. Thompson and Sinkinson 597
from molten slags, etc. ; Separation and recovery of ——. (P) Dasgraz 699
Passivity of ——. Byers and Langdon 1094
precious ; Extraction of —— from their carrier. (P) Howson 598
precious ; Obtaining adherent deposits of —— on alloys not usually thought suitable for the manufacture of plated ware. (P) Murat 970
precious ; Recovery of —— from very dilute solutions. (P) Baur and Nagel 88
precious ; Separation of —— from ores. (P) Reinohl 87, 600r
precious ; Vacuum drum filters for concentrating ——. (P) Spence 187, 241r
Precipitation of —— from cyanide solutions. (P) Butters 489
Precipitation and separation of —— from solutions.
(P) Towne and Robinson 320
(P) Urquhart 426
Precipitation of —— from solutions of their salts. (P) Jacquier 926
Precipitation of —— from solutions of their salts by yellow phosphorus. Bird and Diggs 787
Preparation of ——. (P) Strohmenger 144r
Preparation of colloidal solutions of base —— by disintegration. Zavrieff 597
Preparation of —— in a minutely divided state. (P) Kast 205
Preparation of pure ——. Billy 317
Preventing oxidation of —— during annealing. (P) Thompson and others 264
Process of casting from volatile ——. (P) Hall 795
Process for fusing ——. (P) Ester and Co., Ltd. 264r
Process for mixing —— with molten metal. (P) Boggs 144
Process for pickling ——. (P) Davidson 355, 871r
Process for protecting —— against corrosion. (P) Kaiser 600
Process for protecting and ornamenting ——. (P) Tronel 700, 795r

Process for refining ——:
(P) Patton 488
(P) Rockey and Eldridge 597
Process for removing the coating from plated —— by means of mercury. (P) Albert and others 835
Process for rendering non-ductile —— ductile. (P) Trenzen 144*r*
Process of smelting ——. (P) Hilliard, and New England Metal and Machine Co. 31
Process of welding ——. (P) Lincoln 1015
Production of colorations and black tints on ——. (P) L'Aluminium Français 489, 600*r*
Production and refining of ——. (P) Frumkin 1161
Production of refractory ——. (P) Kuzel, Wedekind, and General Electric Co. 361*r*
Pumping apparatus for making long pipes, etc., from molten ——. (P) Debauge 320, 425, 598
Purification of ——. (P) Bucher, and Nitrogen Products Co. 264*r*
of the rare earths; Manufacture of compounds of the ——. (P) Gebr. Siemens und Co. 830
rare; Preparation of colloidal solutions of ——. (P) Grauert 1075
Reduction of easily oxidisable —— in an inert atmosphere. (P) Knöfler und Co. 699
Salicylate electrolytes for use in electrodeposition of ——. (P) Marino 86, 600*r*
Salt-bath furnaces for heating and tempering ——. (P) Brayshaw and Brayshaw 1161
Separation of —— from their ores. (P) Wolf 926
Separation of —— from ores and compounds containing zinc. (P) Ashcroft 426*r*
Single- or multi-phase electric furnace for treating molten ——. (P) Lescure 794, 970*r*
Sintering and stretching of ——. (P) Seifert 870
Smelting or refining —— in crucibles. (P) Solomon .. 31*r*
Solidification of ——. Robin 596
Solidification of —— from the liquid state. Report to Beilby Prize Committee, Institute of Metals. Desch 318
Solution of —— in acids. Thiel 868
Surface tension of molten ——. Smith 924
Tilting furnace for melting ——. (P) Lambot .. 832, 832*r*
Tipping furnace, heated by liquid fuel, for melting, smelting, or refining ——. (P) Price 554
Transparence or translucence of the surface film produced in polishing ——. Beilby 318
Treatment of ——. (P) McLarty 31, 490*r*
Treatment of —— and apparatus therefor. (P) Devaucelle 89
Treatment of —— to prevent rusting. (P) General Electric Co. 489, 490*r*
Treatment of —— to render them ductile and malleable. (P) Westinghouse Metallfaden Glühlampenfabrik 554*r*
volatile; Electrical smelting of ——. (P) Johnson .. 86
Volatilisation of —— from ores and apparatus therefor. (P) Timm 599
The Widmanstätten structure in various ——. Belaiew 925
Methane in air; Apparatus for measuring the content of ——. (P) Akkumulatorenfabrik 190, 505*r*
in air; Detection of ——. (P) Akkumulatorenfabrik 190
and air; Dilution-limits of inflammability of mixtures of ——. Coward and Brinsley 851
and air; Limits of inflammability of mixtures of ——. Burgess and Wheeler 1194
and air: Propagation of flames in mixtures of ——. The "uniform" movement. Wheeler 1195
and air; The velocities of flame in mixtures of ——. Parker and Rhead 1000
Determination of —— by a modification of the Jaeger method. Wibaut 823
Electrical detection of ——. Ralph 1082
Enrichment of gases with ——. Jochum 242
Inflammability of mixtures of —— with various gases. Leprince-Ringuet 781
Limits of inflammability of ——. Leprince-Ringuet .. 737
mixed with oxygen and nitrogen; Lower limits of inflammation of ——. Parker 541
oxygen, and nitrogen: The propagation of flames in "limit" mixtures of ——. Burgess and Wheeler 1104
Physiological effect of ——. Rybak 1169
Methoxyl group; Determination of the —— in substances containing sulphur. Kirpal and Bühn 570
Methyl acetate; Preparation of a liquid consisting chiefly of ——. (P) Helbronner and Criquebeuf 502
N-Methyl-α-acetylindole. Diels and Dürst 1113
Methyl alcohol; Colour reaction for the detection of ——. Manzoff 497
in corn silage; Occurrence of —— Hart and Lamb .. 1109
Detection of ——:
Blanksma 329
Rinck 978
from hardwoods; Production of —— in the United States. Palmer 345
from hydrolysed lignocelluloses; Recovery of ——. (P) Lederer and Lederer 478
Process of refining ——. (P) Hawley and Little 954
in spirituous liquors; Detection of ——. Vivario .. 935
Thermal decomposition of ——. Bone and Davies 766
in the vapours produced in disinfecting rooms with formaldehyde; Content of ——. Lockemann and Croner 662

PAGE
Methyl alcohol—*cont.*
from vegetable matter; Gas producer for recovering ——. (P) Felizat 243
from wood. Baskerville 1083
bis-Methylaminotetra-amino-arsenobenzene; Manufacture of ——. (P) Boehringer und Söhne 41, 161*r*
Preparation of soluble derivatives of ——. (P) Boehringer und Söhne 374, 569*r*
2-Methylanthraquinone; Manufacture of chloro derivatives of ——. (P) Act.-Ges. f. Anilinfabr. 18
5(4)-Methyl-4(5)-arylaminomethyliminazoles; Preparation of ——. (P) Gerngross 1004
Methylcelluloses; Hydrolysis of ——. Denham and Woodhouse 1084
Methyl chloride; Manufacture of ——. (P) Lacy, and Roessler and Hasslacher Chemical Co. 1075
Methylcyclopentenone; Synthesis of a ——. Godchot 1074
Methylenecyclopropane and its conversion into divinyl. Merejkowsky 1225
α-Methylgalactoside; Biochemical synthesis of ——. Hérissey and Aubry 272
Methylglucose; Mono ——. Irvine and Hogg 657
α-Methylglucoside; Action of maltase on ——. Rona and Michaelis 37
Influence of alcoholic strength on the biochemical synthesis of —— by α-glucosidase. Aubry 1112
Preparation of ——. Aubry 982
Methylglucosides; Structures of the two ——, and note on a third. Fischer 770
Methylhexamethylenetetramine thiocyanate; Preparation of ——. (P) Schmitz 43, 375, 439, 440*r*, 845, 845*r*
Methylnaphthalenes. Lesser 18
Methylpentosans; Influence of the production of ω-hydroxy-δ-methylfurfuraldehyde from carbohydrates on the determination of ——. Cunningham and Dorée 1024
Methylpentoses; Constitution of the ——. Gilmour 211
Methylphenylglycine-arsinic acid and its reduction product; Preparation of ——. (P) Poulenc frères and Oechslin 276
i-Methyltetrose and *i*-methyltetritol; Synthesis of an ——. Gilmour 211
Methyl thiocyanate and hexamethylenetetramine; Preparation of a compound of ——. (P) Schmitz 43
Metric carat; The —— 444
Metropolitan Railway; Experiments with rail steels for electric railways on the ——. Willcox 260
Metropolitan Water Board reports 979, 980
Mexico; Wild silk from —— 476
Mica sheets; Process and apparatus for making ——. (P) Meirowski und Co. A.-G. 81
waste; Manufacture of electrically insulating sheets, plates, etc., from ——. (P) Bölling 206*r*
Microbes suspended in water; Removal of —— by means of a current of air. Trillat and Fouassier 1070
Microbiological processes; Influence of colloids on ——. Söhngen 329
Micro-organisms; Lack of hereditary accommodation of —— in feebly nutritive media. Richet 761
of soils; Action of mineral fertilisers on some ——. Lumia 759
Microscope; The high-temperature ——. Kittl 104
Midland Railway Locomotive Works, Derby; Visit to ——. Annual Meeting 725
Military garments; Waterproofing of ——. Le Roy 1153
Milk; Apparatus for pasteurising ——. (P) Tödt 709
Apparatus for sterilising, pasteurising, and condensing ——. (P) Reynierse 842
Capillary analysis of ——. Goppelsroeder 882
of the carabao; Composition of ——. Dovey 98
Comparison of the microscopical method and the plate method of counting bacteria in ——. Brew 708
Composition of ——. Richmond 708
Composition of —— as shown by analysis of pure samples made by the Massachusetts State Board of Health. Lythgoe 1166
Condensation or concentration of —— by filtration. (P) Kuhn 99*r*
The cryoscopic method for the detection of added water in ——. Maclaurin 1068
cultures; Apparatus for preparing ——. (P) Mott and others 330
Decomposition of proteins in —— by lactic ferments. De Graaff and Schaap 156
The deposit obtained by centrifuging ——. Wardlaw .. 937
Detection of added water in ——. Leather 1068
Detection of added water in —— by a molecular concentration constant. Mathieu and Ferré 214
Detection and determination of benzoic acid in ——. Hinks 37
Determination of casein in —— by means of ferric alum. Arny and Schaefer 979
Determination and significance of ammonia in ——. Tillmans and others 330
Determination of sucrose and lactose in condensed —— by means of acid mercuric nitrate. Revis and Payne 1166

Milk—*cont.*
- Determination of the viscosity of —— as a means of detecting addition of water. Kooper 708
- Electrical conductivity of —— during concentration. Determination of end point in making sweetened condensed milk. Jackson and others 59
- Electrical treatment of —— during churning. (P) Combe 435
- filters. (P) Poupart 1024
- Freezing of ——. Parenty 498
- Machine for desiccating ——. (P) Thardy 215
- Manufacture of artificial —— and apparatus therefor. (P) Von Rigler 215, 564*r*
- Manufacture of desiccated ——:
  - (P) Campbell 274*r*
  - (P) Davis 661*r*
- Manufacture of vinegar from ——. (P) Huberty et Cie. 370
- powder; Recovery of finely-divided —— from air, etc. (P) Merrell-Soule Co. 1024
- Preparation of butter —— which can be preserved for a long time. (P) Suwelack 763
- Preparation of dried —— or milk powder. (P) Casein Co. of America 842*r*
- preparations; Determination of sucrose in ——. Rakshit 497
- preparations; Production of stable, concentrated ——. (P) Sauer 1024
- Preservation of desiccated ——. (P) Boberg and others 937
- Process and apparatus for clarifying ——. (P) Aktiebolaget Separator 882
- Process and apparatus for sterilising ——. (P) Nielsen 882
- Process for curdling ——. (P) Brensike 215
- Process for stabilising ——. (P) McMullen 330
- Process for sterilising ——:
  - (P) Bonine 98
  - (P) Henri and others 498*r*
- Process for utilising the heat of pasteurised ——. (P) Domke 763
- product; Manufacture of a fermented ——. (P) Thoumaian 803
- Rapid method for determining casein in ——. Walker 273
- samples; Preservation of —— for analysis. Tillmans and others 1105
- separating machine; Centrifugal ——. (P) Hauberg . 99*r*
- -separator slime; The lipoids of —— and their importance in the formation of milk fat. Laxa and Konecny 214
- separators; Centrifugal ——:
  - (P) David 1024
  - (P) Lanz 842
- Sterilisation of —— and apparatus therefor. (P) Shelmerdine 38, 38*r*
- Titration of —— with alcohol of various strengths. Löhnis 1106
- Treatment of ——:
  - (P) Fox and others 1168
  - (P) Tait 564

Millet; Occurrence of hydrocyanic acid in ——. Furlong 1069

Mills for grinding, crushing, pulverising, separating, or mixing. (P) Allen and Co., Ltd., and others 126
- for grinding, pulverising, etc. (P) Kniskern 907
- for wet-grinding; Compound ——. (P) Polysius Eisengiesserei u. Maschinenfabrik 907

Mine air; Methods of determining carbon monoxide in ——, and a suggested method of removing it. Harger .. 1081

Mineral industry of South Africa in 1913 1056
- oils. *See under* Oils, hydrocarbon.
- production of Canada in 1913 424
- production of Canada in 1913. McLeish 834
- production of the Philippine Islands in 1913 834
- production of the United Kingdom in 1912 84
- production of the United Kingdom in 1913 .... 487, 810
- production in the United States 143
- production of Western Australia in 1913 925
- substances; Separation of —— by the selective action of oil. Report of Patent Case. Ore Concentration Co. *v.* Sulphide Corporation 927
- substances to be united by briquetting; Treatment of ——. (P) Rônay, and General Briquetting Co. .. 360
- waters; Determination of gaseous hydrocarbons dissolved in ——. (P) Hauser 336
- wax; Refining and decolorising ——. (P) Von Boyen, and Wachs u. Ceresin Werke zu Hamburg 473*r*

Minerals; Apparatus for washing ——:
  - (P) Dodds 426*r*
  - (P) Habets and France 471
- Fractionation of —— in the electric micro-furnace. Fletcher 104
- Method and means for separating different kinds of ——. (P) Blackhurst and Blackhurst 469
- Microscopical investigation of opaque ——. Stutzer .. 1160
- Process of mixing —— with molten metal. (P) Boggs 144
- Treatment of —— and extracting metal. (P) Junquera 836*r*

Mines; Composition for agglutinating dust in ——. (P) Belger 954*r*
- Detection of dangerous gases in ——. (P) Schaufi 910
- Explosions in ——. Sixth Report of the Committee .. 1144
- Means for detecting inflammable gases in ——. (P) Manley and Sandy 910
- Suppression of explosions in —— by use of non-combustible dust. (P) Cremer 584

Minnesota; Manganese ore deposit in —— 595

    (P) Monkhouse and Denton 87
  copper, and aluminium; Alloys of ——. Guillet 358
  -copper-gold alloys; Ternary ——. De Cesaris 261
  -copper-gold-silver alloys; The quaternary ——. Parravano 1092
  and copper; Hardness and modulus of elasticity of isomorphous mixtures of ——. Kurnakow and Rapke 752
  -copper-iron alloy; Manufacture of a ——. (P) Clamer 319
  -copper-lead alloys; Ternary ——. Parravano 1212
  -copper-manganese alloys; Electrical resistance and temperature coefficient of ——. Gray 792
  -copper matte; The roasting of ——. Kern and Merris 142
  -copper ores; Chloridising the Sudbury ——. Carpenter 696
  Deposition of —— on aluminium or other metal, glass, or porcelain. (P) L'Aluminium Français 599
  Determination of —— by means of dimethylglyoxime. Brunck 712
  Electrodeposition of ——. Bennett and others 1012
  Electrolytic determination of ——. Marsh 1228
  Electroplating aluminium with ——. Canac and Tassilly 142
  Extraction of —— from copper ores containing nickel. (P) De Burlet 1014
  Extraction of —— especially from low-grade ores and products. (P) Borchers and Pedersen 755r
  Extraction of —— from mixtures of nickel and other metals. (P) Fierz 836r
  Extraction of —— from its ores. (P) Mineral Products, Ltd., and Woltereck 88
  in fats; Detection of ——. Kerr 362
  in glaze colours. Wicks and Mellor 258
  Impregnation of iron, steel, or cast iron with ——. (P) Hyde 1160
  -iron alloy. (P) Gleason, and Neu-Metals and Process Co. 554
  -iron alloys deposited electrolytically from sulphate baths at high temperatures. Kremann and Maas 791
  -iron alloys; Electrical separation and examination of ——. Kremann and others 25
  -iron alloys; Resistometric study of some ——. Schleicher and Guertler 553
  iron, and carbon; Chemical and mechanical relations of ——. Arnold and Read 423
  and nickel-bronze coinages of the world to the end of 1912 1157
  -plated aluminium. Tassilly 697
  -plating of aluminium; Process for the direct ——. (P) Canac 88
  Polymorphic change in ——. Baikow 1094
  Process for soldering ——. (P) Autogenwerk Sirius 205, 836r
  Reaction for ——. Malatesta and Di Nola 335
  Recovery of —— from its ores:
    (P) Sulman, Picard, and Roberts 30, 489, 490r
    (P) Madagascar Minerals Syndicate, Ltd. 361r, 836r, 836r
  Relation between the variations of magnetism and electrical resistance of —— at high temperatures. Honda 595
  Separation of —— from cupriferous sulphide ores and metallurgical products. (P) Borchers and Thilges 488
  -steel; Effect of slag inclusions on the structure of a ——. Giolitti and Zoblena 1210
  -steel; Influence of gases on rich ——. Froehlich 487
  -steels; Specific volumes of ——. Chevenard 791
  World's production of —— 833
Nickel oxide; Emissivity of —— in the range 600°—1300° C. Burgess and Foote 925
  oxide and protoxide; Tariff treatment of —— in Sweden 829
  oxide; Reduction of ——. Sabatier and Espil 1092
  oxide; Reduction of —— by hydrogen in presence of a dehydrating agent. Berger 752
Nickel—*cont.*
  oxides; Manufacture of a mass of higher —— for use in positive electrodes of alkaline accumulators. (P) Svenska Ackumulator Aktiebolaget Jungner 871, 871r
  peroxide. Tanatar 198
  suboxide; Existence of a ——. Sabatier and Espil 851
  suboxide; Manufacture of —— for catalytic purposes. (P) Boberg and others 559r
  sulphide. Thiel and Gessner 810
  tannates. Singh 172
  underglaze colours. Perry 258
Nickelous hydroxide; Colloidal ——. Paal and Brünjes 787
  oxide; Reduction of ——, and existence of a suboxide. Sabatier and Espil 851
Nicotine from tobacco waste; Process for preparing ——. (P) Halle 221
  from waste tobacco plants; Improved yield of ——. Chuard and Mellet 1071
m-Nicotine. Maass and Zablinski 939
Nigeria; Golawal, katalabu, and kol-kol gums from Northern —— 495
  Tin resources of —— 1054
Nigerian monazite. Johnstone 57
Niobium; Reduction of quinquevalent ——. Stähler 918
Nipa palm as a commercial source of sugar. Pratt, Williams, and Gibbs 456
  palm leaves for paper making 477
Nipissing mill, Ontario; Desulphurisation of silver ores at the —— 596
Niton as a therapeutic agent. Ramsay 666
Nitrate contents of arable soils; Fluctuations of the ——. Russell 210
  industry of Chile 76
Nitrates; Analysis of —— by a new reduction method. Russo and Sensi 279
  in certain Colorado soils; Excessive quantities of ——. Headden 799
  Detection and determination of —— by a very delicate colorimetric method. Letts and Rea 570
  Determination of ——. Molinari 419
  Effect of magnesium chloride on the oxidising action of ——. Hofmann and others 742
  in the glass industry; Use of ——. Springer 683
  Process for dehalogenising halogeniferous ——. (P) Uebel 137r
  Production of commercially pure ——. (P) Bosch and others 1154r
  Reaction of —— with formic acid. Molinari 419
  Reduction of —— to nitrites and ammonia by bacteria. Klaeser 877
  Separation of —— from mixtures of nitrates and nitrites. (P) Collett, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 1009r
  in soil; Relation of certain plants to the formation of ——. Lyon and Bizzell 1021
Nitrating apparatus. Explosion of a cast-iron benzene ——. Pikos 586
Nitric acid; Action of strong —— on cotton cellulose. Knecht and Lipschitz 116
  Concentration of dilute ——. (P) Salpetersäure-Industrie-Ges. 790r
  Continuous manufacture of ——. (P) Saccharin-Fabr. A.-G. vorm. Fahlberg, List und Co. 455r
  Conversion of ammonia into —— from an economic standpoint. Dieffenbach 590
  Detection of —— by means of ferrous sulphate. Bellucci 944
  Influence of movement on the solution of copper in ——. Drapier 251
  Manufacture of ——. (P) Casman 765r
  Manufacture of —— from calcium nitrate. (P) Traine und Hellmers, and others 811
  Manufacture of highly concentrated or monohydrated ——. (P) Verein Chem. Fabriken in Mannheim 811, 455r, 1154r
  Manufacture of —— from nitrates and sulphuric acid. (P) Uebel 200, 319r
  Process for concentrating ——:
    (P) Collett 482, 482
    (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab 455r
  Process for concentrating aqueous ——. (P) Pauling 201r
  Production of concentrated ——. (P) Bossi 421, 421
  in rainfall near Melbourne; Influence of weather conditions on the amount of ——. Anderson 976
  Resistance of platinum vessels to hot ——. Baxter and Grover 690
  Solubility of silica in ——. Wunder and Suleimann 279
  vapours; Apparatus for condensing ——. (P) Leblanc 811
  vapours; Process for drying ——. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab 643
  in water. Preparation of the hydrostrychnine reagent for the colorimetric determination of ——. Denigès 1070
Nitric oxide; Catalytic combustion of ammonia, hydrocyanic acid, and cyanogen to ——. Moldenhauer and Wehrheim 745
  and chlorine; Rate of combination of gaseous ——. Coates and Finney 1296
  Compounds of —— with ferrous and copper salts. Manchot 642, 643

Nitric oxide—*cont.*
  Decomposition of —— at high pressures. Briner and Boubnoff 21
  and ferrous chloride ; Supposed crystalline compound of ——. Bellucci 1205
  Formation of nitrous anhydride by the action of oxygen on ——. Klinger 74
  in lighting and heating flames ; Quantity of ——. Terres 825
  Production of —— from atmospheric nitrogen. Haber 52
  Production of —— by electric oxidation of atmospheric nitrogen. (P) Rossi 421, 1154*r*
Nitrides ; Continuous manufacture of ——. (P) Gebr. Giulini Ges. 421
  Dissociation pressures of some ——. Slade and Higson 642
  Manufacture of —— :
    (P) Contagne 255
    (P) Margoles 549
    (P) Soc. Générale des Nitrures 313*r*, 550*r*
  Purification of mixtures containing ——. (P) Badische Anilin und Soda Fabrik 831*r*
Nitrification in arable soils ; Influence of organic matter on —— :
    Barthel 759
    Kossowicz 841
  Experiments on the rate of ——. Beesley 564
Nitrites ; Detection and determination of —— by means of diphenylbenzidine. Marqueyrol and Muraour 335
  Detection and determination of —— by an extremely delicate colorimetric method. Letts and Rea 570
  Fresenius' method for the determination of ——, and its sensitiveness compared with the *m*-phenylenediamine method. Letts and Rea 938
  Gravimetric determination of ——. Busvold 104
  Investigations on ——. Oswald 419
  Reduction of nitrates to —— by bacteria. Klaeser 877
  Separation of —— from mixtures of nitrates and nitrites. (P) Collett, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 1009*r*
  in water ; Detection of —— Bornand 1110
α-Nitro-acyldiaminoanthraquinones ; Preparation of ——. (P) Bayer und Co. 246
β-Nitro-acyl-*p*-diaminoanthraquinones ; Preparation of ——. (P) Bayer und Co. 70
Nitro-aminobenzene-arsinic acids or their derivatives ; Manufacture of ——. (P) Boehringer und Söhne 806
Nitro-*m*-aminophenols ; Acidylated ——. Reverdin and Widmer 855
Nitro-*m*-anisidines ; Acidylated ——. Reverdin and Widmer 855
  Comparison of the azo dyestuffs from —— with those from the corresponding nitranilines. Reverdin and Widmer 855
Nitrobenzene factory at Rummelsberg : Explosion at the —— 376
Nitrobenzene-diazonium derivatives ; Stable ——. (P) Witt, and Act.-Ges. f. Anilinfabr. 545*r*
Nitrobenzenesulphonic acids ; Formation of isomeric ——. Self-orientation of substituents. Obermiller 130
Nitro-bodies ; Purification of ——. (P) Silberrad 587*r*
Nitrocarbazoles and their N-alkyl derivatives ; Preparation of poly- ——. (P) Cassella und Co. 193
Nitrocellulose for collodion ; Manufacture of ——. Chandelon 222
  Determination of nitrogen in —— by means of the nitrometer. Beckett 628
  Manufacture of ——. (P) Verein. Kunstseidefabriken A.-G. 161*r*, 569*r*
  Manufacture of compounds of ——. (P) Bachrach 958*r*
  Manufacture of solutions of ——. (P) Weedon, and du Pont de Nemours Powder Co. 132*r*
  manufacture ; Source of error in the analysis of waste acids from ——. Chandelon 334
  Process for purifying ——. (P) Duclaux 222
  Production of solvents of ——. (P) Masland, and du Pont de Nemours Powder Co. 219
  Solubility of —— in ether-alcohol. Matteoschat 376
  Solubility of —— in ethyl alcohol. Schwarz 744
  solutions ; Method of spinning —— to produce threads, films, etc. (P) Berl and Isler 746
  solutions ; Viscosity of —— in alcoholic camphor solutions. Nishida 476

- Oils, fatty—*cont.*
  - Whale oil; Constants of ——. Lund 756
  - Whale oil; Hardened ——. Mellana 701
  - Whale oil; Hydrogenated ——. Sandelin 1097
  - Whale oil; Production and utilisation of ——. Offerdahl 32
- Oils, hydrocarbon:
  - Crude oil for the assay furnace. Haldane 15
  - Heavy oils as fuels; Use of —— 193
  - Heavy oils in internal-combustion engines; Use of ——. Drexler 1146
  - Light oil from gas-washing oils; Process for separating ——. (P) Koppers 411
  - Light oils; Production of —— from crude, heavy, or lighting oils. (P) Moeller and Woltereck 853
  - Lubricating oils; Investigation of naphthenic acids from heavy commercial ——. Herr 1147
  - Mineral oil; Apparatus for converting —— into volatile spirit. (P) New Oil Refining Process, Ltd., and Rossini 472
  - Mineral oil exports from the United States 823
  - Mineral oil industry of the Caucasus 635
  - Mineral oil; Manufacture of products from ——:
    - (P) New Oil Refining Process, Ltd., and Lomax 543
    - (P) New Oil Refining Process, Ltd., and Rossini 244
  - Mineral oil; Method and apparatus for purifying ——. (P) Shiner 740, 741*r*, 853*r*
  - Mineral oil or residuum; Manufacture of asphaltum from crude ——. (P) Forward 344
  - Mineral oil; Treatment of ——. (P) Dehnst 1044*r*
  - Mineral oils; Analysis of ——. Kantorowicz 66
  - Mineral oils; Apparatus for fractionating ——. (P) Forward 824
  - Mineral oils; The constituents of high-boiling ——. Marcusson 66
  - Mineral oils; Detection of rosin oil in —— 1147
  - Mineral oils; Determination of paraffin wax in ——. Schwarz and von Huber 1147
  - Mineral oils; Diminishing the viscosity of ——. (P) Philip 824
  - Mineral oils; Manufacture of olefines and their oxidation products from ——. (P) Greenstreet 1002
  - Mineral oils; Method of treating ——. (P) Melamid.. 473*r*
  - Mineral oils; Process and apparatus for distilling ——. (P) Kubierschky 68, 473*r*
  - Mineral oils; Removal of acid from —— after acid treatment. (P) Burkhardt 473
  - Mineral oils; Separation of acid tar from ——. (P) Burkhardt 305
  - Mineral oils; Simple method for calculating the viscosity of mixtures of ——. Molin 739
  - Mineral oils; Solidifying —— and converting them into dry powders by means of malt extract or maltodextrin. (P) Hamburg 603*r*
  - Mineral oils; Theoretical problems involved in the cracking of ——. Rittman 626
  - Mineral oils; Treatment of acid sludge and liquors produced during the washing of ——. (P) Rütgerswerke A.-G. 473*r*
  - Mineral oils; Treatment of —— for medicinal purposes. (P) Wallach 889
  - Mineral oils; Use of the Kubierschky column in distilling ——. Graefe 1146
  - Mineral oils; Viscosities of some ——. Strevens.. 109, 110
  - Motor oils; Determination of the self-ignition temperature of ——. Constam and Schläpfer 410
  - Motor spirits; Determination of sulphur in ——. Bradbury and Owen 1001
  - Process for treating ——. (P) Wohle, and Wohle Mineral Oil Products (1910), Ltd. 69*r*
  - Separation of solid paraffins from ——. (P) Allgem. Ges. f. Chem. Industrie 1149
  - Transformer oils. Brauen 951
  - Treatment of —— for cracking, particularly to make liquid fuel. (P) Luck 685
  - Treatment of heavy ——. (P) Greenstreet 1002
- Oily material; Process for hydrogenating ——. (P) Ellis 208r, 208*r*
  - substances; Fractional distillation of ——. (P) Koppers, and Koppers Co. 783
  - waste or rag; Recovery of oils from ——. Ayres.... 1098
- Ointment-like masses for medicinal or cosmetic purposes. (P) Eichengrün 221
- Ointments; Manufacture of trimethylamine derivatives for use in making ——. (P) Herzmann 838
- Olary ores; Extraction of radium from the ——. Radcliff 229
- Oleaginous seeds; Preventing shaking and jarring in presses for —— during discharge of the oil-cakes. (P) Harburger Eisen- u. Bronzewerke A.-G. 973
- Oleanol; Derivatives of ——. Tutin and Naunton 102
- Olefines and their oxidation products; Manufacture of ——. (P) Greenstreet 1002
- Oleic acid; Action of halogens on ——. Meigen and Winogradoff 556
  - Catalytic reduction of —— by hydrogen in presence of finely divided nickel. Shaw 771
  - Oxidation of —— in presence of sunlight. Canzoneri and Bianchini 323
  - stearic acid, and palmitic acid; Refractive indices of mixtures of ——. Pascal 602
  - from train or fish oil; Process for deodorising ——. (P) Hofmann 324, 492*r*

  - Use of fluorides and fluorine compounds for making submarine ——. (P) Paterno and Manuelli 604
- Paleozoic plants; Resins in ——. White 682
- Palladium; Absorption and adsorption of hydrogen by ——. Halla 280
  - and its alloys: Absorption of hydrogen by ——. Sieverts 751
  - in crude platinum; Determination of ——. Schwitter 751
  - -hydrogen alloys; Specific electrical conductivity and density of ——. Wolf 649
  - Rate of solution of hydrogen by ——. Holt 571
- Palladium hydroxide; Organosols of divalent ——. Amberger 41
- Palm kernels; The trade in —— 1060
  - nut kernel cake. Murray 1218
  - oil. *See under* Oils, fatty.
- Palmitic acid, stearic acid, and oleic acid; Refractive indices of mixtures of ——. Pascal 602
  - stearic acid, tripalmitin; The ternary system ——. Kremann and Klein 928
  - stearic acid, tristearin; The ternary system ——. Kremann and Kropsch 929
- Palmitic products; Production and utilisation of sulphonated ——. (P) Levinstein 875
- Palmitin, olein, and stearin; Refractive indices of mixtures of ——. Pascal 602
- Panama bark; Treatment of —— to prevent production or separation of dust. (P) Mandelbaum, and Kauffmann and Co. 668*r*
- Panang seed and its oil 147
- Pancreatic extracts; Stable —— for industrial use. (P) Lepetit, Dollfus & Gansser 613
- *Papaver orientale*; Alkaloids of ——. Klee 885
  - Subsidiary alkaloids of ——. Gadamer 1026
- Papaveraldine methosulphate; Oxidation of ——. Mason and Perkin 939
- Paper; Apparatus for drying —— for test purposes. Beadle and Stevens 730
  - Board of Trade Bulletin on —— 1085*r*
  - Casein for coated ——. Sutermeister 588
  - Coated —— and process of making same. (P) Wrede, and Corn Products Refining Co. 349
  - Compression and density of raw materials for the manufacture of ——. Beadle and Stevens 745
  - from different deciduous and coniferous woods by the soda and sulphite processes; Comparison of various kinds of ——. Beadle and Stevens 545
  - Dry and wet strengths of ——. Beadle and Stevens 639
  - Drying and surface finishing of ——. (P) Pope 688
  - Durability of high-grade ——. Herzberg 545
  - from *Hedychium*; Effects of mineral loading on the physical qualities of ——. Beadle and Stevens 308
  - Influence of addition of *Hedychium* pulp to chemical and mechanical wood pulps, on the physical qualities of ——. Beadle and Stevens 688
  - loading materials; Behaviour of —— to dyestuffs. Von Ehrenthal 858
  - machine; Arrangement for regulating the weight of pulp in the stuff-box of the ——. (P) Rüdiger 958
  - making; Beating engines for ——. (P) Marx 20, 20, 916*r*
  - making; Bleaching esparto grass, etc., for ——. (P) Dobson 20
  - making; Examination of commercial gelatins for suitability for ——. Sindall and Bacon 132
  - making; Nipa palm leaves for —— 477
  - making; Production of colouring-matter for use in ——. (P) Hahn 1006
  - making; *Scilla rigidifolia* leaves from Swaziland for —— 477
  - Manufacture of ——. (P) Wallin 478
  - Manufacture of a flexible and waterproof material from ——. (P) Magnasco 640, 746*r*
  - Manufacture of mottled or patterned ——. (P) Zarnowiecki 132*r*
  - Manufacture of opaque ——. (P) Daigre and Bailleul 640
  - Method and apparatus for making ——. (P) Buchanan 785
  - Microscopical examination of ——. Kollmann 308
  - mills; Apparatus for clarifying waste waters of ——:
    - (P) Mann und Co. 478
    - (P) Mann and Heess 859*r*
  - Oxford India —— 1202
  - Photographic printing ——:
    - (P) Kent 221
    - (P) Sury 43
  - Preparation of paraffined ——. (P) Lutz 417
  - Process for bleaching fibres for the manufacture of ——. (P) Lannoye 132*r*
  - Process for drying ——. (P) Butts 546
  - Process of sizing ——. (P) Dubois und Kaufmann 859
  - pulp; Apparatus for the preparation of ——. (P) Rice 132
  - pulp; Apparatus for straining ——. (P) Beaumont 417, 1085, 1152
  - pulp from bamboo and the like; Production of ——. (P) Jardine and Nelson 1006
  - pulp; The bleaching of chemical —— with suggestions for a standard method. Baker and Jennison 284
  - pulp; Centrifugal apparatus for purifying ——. (P) Fearoley and Geen 478*r*
  - pulp flock; Process for briquetting fuel by means of dry ——. (P) Reinold 17*r*
  - pulp; Machines for preparing ——. (P) Beaumont 828
  - pulp; Machines for straining ——. (P) Beaumont 916
  - pulp; Manufacture of ——. (P) Watford Engineering Works, Ltd., and Paramor 688
  - pulp manufacture; Notes on sulphite ——. Frohberg 857
  - pulp; Manufacture of sulphite ——. Kuhn 744
  - pulp; Method and means for bleaching ——. (P) Couper 478
  - pulp; Preparation of ——:
    - (P) Bache-Wiig and Chisholm 196, 417*r*
    - (P) Jackson 132*r*
    - (P) Stewart 589
  - pulp; New sources of supply of raw material for —— in the United States. Nunez 744
  - pulp; Production of —— from resinous woods. (P) Soc. Anon. Le Camphre 430
  - pulp stuff; Apparatus for refining ——. (P) Nash 640

Paper—*cont.*
  pulp; Suitability of long-leaf pine for ——. Surfaco and Cooper ... 857
  pulp; Terpene by-products in the manufacture of ——. Luttringer ... 745
  pulp; Treatment of ——. (P) Marx ... 20, 589*r*
  Recovery of ammonia from ——. (P) Stauber and Kochan ... 543
  Recovery of pulp from waste ——. (P) Burby, and The Pembec Co. ... 1045*r*
  Removal of ink from printed ——. Wangner ... 858
  for roofing, etc.; Manufacture of non-inflammable ——. (P) Maschke ... 138
  sizes; Report on commercial ——. Von Possanner ... 131
  sizing; Detection of rosin and animal ——. Kollmann 1203
  sizing; Preparation of ——. (P) Dunham, and Casein Co. of America ... 72
  standards and paper testing. Cross ... 828
  stock; Drying machine for ——. (P) Woodsome, and Crane Co. ... 1152
  suitable for security-cheques; Manufacture of ——. (P) Menzies and Aitken ... 308*r*
  superficial metallisation of ——. (P) Marino ... 650*r*
  testing. Strength, bulk, and handle. Briggs ... 745
  Tests for determining the quality of ——. Lamb ... 1005*r*
  Treatment of —— with alginates made from seaweed. (P) Ingham ... 689
  webs; Method and apparatus for drying ——. (P) Bauer ... 858
  yarns; Dry and wet strengths of ——. Beadle and Stevens ... 639

Papua; Ceara rubber from —— ... 1063

Paracasein compounds; Composition and properties of some —— and their relation to cheese. Van Slyke and Bosworth ... 600

Paraffin cancer. Report of Inspector of Factories and Workshops ... 895
  compositions; Process for expressing fluid from ——. (P) Hansen ... 244
  motor; The —— ... 681
  wax; Adulteration of —— with rosin. Parry ... 909
  wax industry in Austria; Application of cold in the ——. Porges ... 1042
  wax in mineral oils; Determination of ——. Schwarz and von Huber ... 1147
  wax; Separation of —— from petroleum oils by cold methods. Rakusin ... 684
  waxes; Refractometric examination of ——. Holde and Franck ... 242

Paraffined paper, pasteboard, etc.; Preparation of ——. (P) Lutz ... 417

Paraffins; Manufacture of dihalogen ——. (P) Matthews and Bliss ... 806
  Separation of solid —— from oils containing them. (P) Allgem. Ges. f. Chem. Industrie ... 1149

Paraldehyde; Manufacture of —— ... 941

Park City, Utah; Chloridizing leaching of low-grade ores at ——. Holt ... 1011

Partial pressures of liquid mixtures; Rapid method of measuring the ——. Rosanoff and others ... 1027

Passivity of metals. Byers and Langdon ... 1094

Pasteboard; Board of Trade bulletin on —— ... 1085*r*
  Preparation of paraffined ——. (P) Lutz ... 417

Pasteurising apparatus for malt beverages, wines, aerated waters, etc. (P) Erikson ... 497
  cream, milk, etc.; Apparatus for use in ——. (P) Tödt ... 709
  liquids; Method and apparatus for ——. (P) Krug ... 710
  liquids such as stout, beer, etc. (P) Gregory ... 1105
  milk; Apparatus for ——. (P) Reynierse ... 842

Pasty masses; Separation of the liquid in —— by centrifuging, and dry-pressing the separated solids. (P) Bertel ... 821

Patchouli oil. Lehmann ... 101

Patent cases; Reports of ——:
  Black colouring matter directly dyeing cotton. Act.-Ges. f. Anilinfabr. *v.* Levinstein ... 915
  Compounds containing unstable oxygen; Increasing the keeping qualities of ——. Sarason *v.* Frenay ... 963
  Mineral substances; Separation of —— by selective action of oil. Ore Concentration Co. *v.* Sulphide Corporation ... 927
  Organic arsenic compounds; Application to suspend patents for certain —— ... 1028
  Peat; Treatment of ——. Jameson and others ... 954
  Permutite; Process of revivifying or restoring ——. Schweikert and Czeczowiczka ... 981
  Precious metal-bearing ores; Treatment of ——. Brown. Action for infringement ... 1016
  Refractory metals and alloys; Manufacture of articles of ——. Schwarzkopf and others ... 1016

Patent law. Resolution of the Association of Chambers of Commerce ... 336

Patents and Designs Act, 1914 ... 813
  and Designs (Temporary) Rules, 1914 ... 847
  Designs, and Trade Marks fees; Payments of —— ... 899
  Designs, and Trade Marks (Temporary Rules) Act, 1914 ... 813, 1118

Patents—*cont.*
  Designs, and Trade Marks (Temporary) Rules, 1914 ... 813
  Designs, and Trade Marks Temporary Rules (Amendment) Act, 1914 ... 847
  Designs, and Trade Marks Temporary Rules (Amendment) Act, 1904; Applications under the —— ... 1037
  Report of the Comptroller-General on —— for the year 1913 ... 444

Paving blocks from fusible domestic and other refuse; Manufacture of ——. (P) Becker and Unger ... 647
  material. (P) Lovegrove and Crompton ... 1053

Pearlite; Production of granular —— by heating steel in an electric vacuum furnace. Ishcwsky ... 1091

Peat; Bacterial treatment of ——. Bottomley ... 366
  By-products from ——. Perkin ... 395
  Cleaning tubular and other vessels used for treating ——. (P) Rigby and others ... 850*r*
  Distillation of ——, and utilising the products for creosoting timber, etc. (P) De Nagy ... 686
  Expressing fluid from —— and apparatus therefor. (P) Sizer ... 428
  Extraction of liquid hydrocarbons or their halogen derivatives from ——. (P) Tischenko and Plauson 244
  Extraction of water from ——. (P) Buckle, and International Nitrogen and Power Co. ... 128
  fuel; Production of ——. (P) Franke ... 684
  The humus of acid and alkaline ——. Hanley ... 210
  Manufacture of artificial fuel from ——. (P) Osius ... 909
  Manufacture of artificial stone from ——. (P) Weiler 965
  Process for distilling ——. (P) Plauson and von Tischenko ... 1150
  Process for heating —— to prepare it for mechanical dehydration. (P) Wolters ... 825*r*
  Production of briquettes and coke from ——. (P) Prioleau and Prioleau ... 303, 304*r*
  Production of volatile liquids from ——. (P) Pease ... 346
  Recovery of ammonia from ——. (P) Stauber and Kochan ... 543, 865*r*
  Regenerative oven for carbonising —— and recovering by-products. (P) Guardabassi and Goulliard ... 473
  Removal of water from ——. (P) Roth ... 69*r*
  Removal of water from wet-carbonised ——. (P) Testrup and others ... 543*r*
  sods which may be stacked immediately, made from partly drained peat. (P) Von Traubenberg ... 823
  tar; The phenols of ——. Börnstein and Bernstein ... 245
  Treatment of ——:
    Petitions for revocation of Jameson's patent ... 954
    (P) Rigby and others ... 911
    (P) Strong ... 954
  Treatment of —— and apparatus therefor. (P) Berglund ... 128
  Treatment of —— in by-product recovery gas producers. (P) Rigby and others ... 852
  Treatment of —— for industrial purposes. (P) Dickson and others ... 953
  Treatment of —— for use as a fertiliser and for other purposes. (P) Bottomley ... 35*r*, 878*r*
  Treatment and utilisation of ——. (P) Leadbeater 17*r*, 1001
  Treatment of —— by wet-carbonisation. (P) Testrup and others ... 543
  Treatment of wet-carbonised ——. (P) Rigby, and Wetcarbonizing, Ltd. ... 1003
  Use of —— for reducing ores. (P) Anderson and son Odelstierna ... 927
  Utilisation of ——:
    (P) Rigby, Andrew, and Wetcarbonizing, Ltd. ... 783
    (P) Rigby, Testrup, and Wetcarbonizing, Ltd. 346
    (P) Rigby, and Wetcarbonizing, Ltd. ... 909

Peaty substances; Heating —— to prepare them for mechanical dehydration. (P) Wolters ... 825*r*

Pectin substances in beet sugar factory products. Koydl ... 1102

Pectinous products from fruits and vegetables; Extraction of alimentary ——. (P) Douglas ... 215

Pectocellulose; Process for bleaching ——. (P) De Vains and Peterson ... 746*r*, 916*r*

Pelts; Process for dyeing ——. (P) Act.-Ges. f. Anilinfabr. 252

Pencils; Substance for use in making coloured ——. (P) Herda ... 149

Penetrometer; Electrically controlled and timed asphaltum ——. Mahr ... 259

Penguin guano from the Falkland Islands ... 800

Pentadesma butyracea fruits and the fat therefrom ... 147

Pentanes; Process for obtaining ——. (P) Schill, and Continental Gas Compressing Corporation ... 824

Pentosans; Influence of the production of ω-hydroxy-*s*-methylfurfuraldehyde from carbohydrates on the determination of ——. Cunningbam and Dorée ... 1024

Pentoses in tanning materials. Reed and Schubert ... 558
  in tanning materials; Determination of ——. Van Gijn and van der Waerden ... 151

Pepper; Detection of turmeric in ——. Parry ... 157

Peppermint industry of Japan ... 159

Pepsin; Bacteriological purity of ——. Quant ... 843
  Chemistry of ——. Herzfeld ... 707

Peptone. Bernardi ... 273

Peptones ; Preparation of ferrous compounds of ——. (P) Hoffmann-La Roche und Co. 42
Per-acids from aldehydes ; Preparation of ——. (P) Consortium f. Elektrochem. Industrie 42, 503*r*
  Formation of —— from organic acids and hydrogen peroxide. D'Ans and Frey 41
Perborate preparations ; Manufacture of stable, easily soluble ——. (P) Verein. Fabr. f. Laboratoriumsbedarf.................................... 484
  Washing powders containing —— and their analysis. Jungkunz.................................... 363
Perborates ; Electrolytic manufacture of ——. (P) Grüter, and Chem. Fabr. Grünau, Landshoff und Meyer.... 24*r*
  Manufacture of —— :
    (P) Hempel 789
    (P) Henkel und Co. 961, 962*r*
  Process for dehydrating ——. (P) Liebknecht, and Roessler and Hasslacher Chemical Co.......... 789
  Stable mixture containing ——. (P) Wünsche, and Pearson und Co. 865*r*
Perchlorates of aluminium, chromium, and magnesium. Weinland and Ensgraber 74
  Analysis of —— by a new reduction method. Russo and Sensi 279
  of aromatic amines. Spallino 712
Perchromic acid ; Preparation of blue ——. Riesenfeld and Mau 310
Per-compounds ; Washing and bleaching with alkaline solutions of ——. (P) Chem. Werke vorm. Dr. H. Byk, and others.................................. 20
Perfumery ; Essential oils free from terpenes and sesquiterpenes used in ——. Mann 886
  industry ; Applications of cold in the ——. Cherchewsky 1073
  trade in Cuba 1073
  Use of mosses in ——. Mann 100
Perfumes ; Process for extracting ——. (P) Meunier.. 613, 815
  Fatty product for use in extracting ——. (P) De Baudicour and de la Gabinière.................. 324
  of lichens. Holmes 100
  Production of ——. (P) Wegener 157
  Removal of —— in enfleurage with fatty bodies. (P) Lautier fils 613, 984
Perkin Medal (New York Section) ; Presentation of —— to Mr. J W. Hyatt 225, 298
Permon powder ; Composition of —— 103
Permutite ; Process for revivifying or restoring ——. Opposition to grant of Schweikert and Czeczowiczka's patent 981
  softening of water by ——. Bahrdt.................. 330
Peroxides. Tanatar 198
  Manufacture of alkali —— and apparatus therefor. (P) Marguet 136, 921*r*
  The stability of alkali ——. De Forcrand............ 481
Peroxydase of dried yeast. Harden and Zilva 761
  reaction ; The sensitiveness of the ——. Bach 891
  reactions of formaldehyde and acetaldehyde. Woker .. 444
Per-salts ; Manufacture of ——. (P) Chem. Werke vorm. Dr. H. Byk 24
Persilicates ; Possible existence of ——. Jordis 253
Persulphates ; Action of —— on acetates. Gordon 198
  Electrolytic preparation of —— without a diaphragm. (P) Bayer und Co. 484, 749
Persulphuric acid ; Manufacture of ——. (P) Bayer und Co. 749
Peru balsam ; Artificial and genuine ——. Dieterich.. 159, 565
  Essential oil obtained by steam distillation of ——. Sortell 565
  oil. Schimmel 665
Petrol-gas and coal gas for lighting ; Comparison of ——. Scott-Snell 686
  Increasing the efficiency of —— in internal-combustion engines. (P) Birtill 853
  Process and apparatus for refining ——. (P) Beer.... 129
  store in the Osthafen, Berlin ; Safety ——. Rosenthal 343
Petroleum ; Apparatus for continuously distilling crude ——. (P) Forward 341
  Apparatus for distilling ——. (P) Ewing, and Standard Oil Co. 190
  Apparatus for refining ——. (P) Warren 1002
  in Assam. Pascoe 1012
  Autoclave apparatus for the transformation of ——. (P) Renard 345
  from Bioritsu, Formosa ; Study of the crude ——. Katayama 683
  and its by-products ; Refining ——. (P) Starke...... 1002
  of California ; The specific heat of various kinds of ——. Wales 952
  Composition of Mid-Continental (U.S.A.) ——. Bushong 1145
  Continuous rectification of —— and apparatus therefor. (P) Barbet 954
  Conversion of —— into oils of lower boiling point. (P) Zerning 304*r*
  Conversion of —— into products having a lower boiling point. (P) Renard 412
  derivatives ; Antiseptic properties of ——. Charitschkow 763, 1111
Petroleum—*cont.*
  Determination of asphaltic material in —— by the so-called excise method. Gurwitsch 1147
  Determination of asphaltum in dark ——. Holde and Meyerheim.................................... 303
  distillates ; Fluorescence of ——. Brooks and Bacon 852
  distillates ; Naphthenic acids from different Baku ——. Pyhälä 634
  and its distillates ; Production of benzene from ——. (P) Holegreber 17, 825*r*
  Distillation of —— :
    (P) Herber 1044
    (P) Koehler, Link, and Standard Oil Co....... 191
  Distillation of —— and apparatus therefor. (P) Van Dyke and others 586
  distillation ; Economy of heat in ——. Uhlmann 741
  and its distillation products ; Determination of asphaltum in ——. Charitschkoff 1147
  distillation ; Treatment of the residue of ——. (P) Standard Oil Co. 825*r*
  Electrically-heated boiler or still for ——. (P) Delort 954
  emulsifiable with water ; Manufacture of ——. (P) Crochepeyre 191
  emulsions ; Treatment of ——. (P) Laird and Raney 1197
  field in Colorado ; De Beque ——. De Beque........ 1042
  field ; The Taranaki ——. Watkins 189
  Fractional distillation of ——. Sanders 851
  hydrocarbons ; Conversion of higher boiling into lower boiling ——. (P) Gray 1044
  hydrocarbons ; Extraction of sulpho-acids from crude ——. (P) Petroff 345*r*
  hydrocarbons ; Treatment of ——. (P) Bacon and Clark 824
  Mahone ——, and its origin. Mabery 242
  oil ; Analysis of ——. Kantorowicz 66
  oil from Baku ; Naphthenic acids of high molecular weight in ——. Pyhälä 739
  oil fractions ; Specific heat of heavy —— at high temperatures. Karawajeff 128
  oil ; Iodine value of ——. Smith and Tuttle 700
  oils ; Alleged occurrence of cholesterol in ——. Steinkopf and Winternitz 584
  oils ; Apparatus for distilling ——. (P) Steinschneider 543
  oils ; Manufacture of aluminium chloride from residues from the treatment of ——. (P) McAfee........ 783
  oils ; Separation of paraffin wax from —— by cold methods. Itakusin 684
  oils ; Treatment of —— with ultra-violet light. (P) Ellis, and Ellis-Foster Co. 344
  pitch in asphaltum and liquid bitumens ; Detection of ——. Halphen and Spiess 189
  Preparation of artificial rubber from ——. Pyhälä.... 1210
  Principal sources of ——. Redwood................ 66
  Process for distilling and mixing ——. (P) Steinschneider 413
  Process for solidifying ——. (P) Gérard 245*r*
  Process for treating ——. (P) Wohle, and Wohle Mineral Oil Products (1910), Ltd............... 69*r*
  production in Canada 909
  Production of crude —— in the principal countries during 1913 635
  Production of light oils from crude, heavy, or illuminating ——. (P) Moeller and Woltereck 853
  production of the United States 128
  Products of destructive distillation of crude Bustenari —— and its derivatives. Petroni............... 1195
  products in oil of turpentine ; Detection and determination of ——. Grimaldi and Prussia 604
  products ; Preparation of saturated aliphatic hydrocarbons from ——. (P) Steaua Romana Petroleum Ges. 191
  prospects in the Union of South Africa ; Report on ——. Craig.................................... 313
  recovery in California ; Methods of ——. Arnold and Garfias 1195
  residues ; Conversion of —— into pitch :
    (P) Rosen 246
    (P) Soc. Anon. des Combustibles Industriels.... 475*r*
  Separation of hydrocarbons of —— by means of sulphur dioxide. Edeleanu 343
  spirit from natural gas ; Production of —— in Galicia. Rozanski 15
  still. (P) Turner and Hart 473
  Synthetic fatty acids from ——. Colletas............ 972
  and tar ; Preparation of nitrous compounds from mixtures of ——. (P) Flexer 17, 347*r*, 742*r*
  Treatment of crude ——. (P) Barnickel 543
  wells ; Premature abandonment of ——. Possibilities of revival 14
Petroleums of California ; Chemical and physical properties of the ——. Allen and others 851
Petroliferous zone of Italy ; Importance of the ——. Galdi 909
Pharmaceutical compounds. (P) Bayer und Co... 161*r*, 161*r*, 569*r*
  compounds ; Manufacture of —— :
    (P) Heinemann 218
    (P) Riedel A.-G. 567
  compounds and preparations ; Limits of lead and arsenic in ——. British Pharmacopœia 982
  preparations ; Determination of nitroglycerin in ——. Heyl and Staley 613

PAGE

Pharmacological activity and lowering of surface tension. Berczeller 886

Pharmacopœias; Comparison of methods of the various — for determination of the active principles of potent drugs and preparations derived therefrom. Dichgans 1025

Pharmacy; Carbon bisulphide in official — and suggestions for its further use. Alcock 843

β-Phellandrene; Action of alcoholic hydrochloric acid on —. Francesconi and Sernagiotto 1222

Phenacetin; Determination of — in admixture with acetanilide. Emery 887

Phenanthrene; Absorption of ultra-violet rays by —. Gompel and Henri 100

Phenanthraquinone; Action of benzene hydrocarbons on — in sunlight. Benrath and von Meyer 955

p-Phenetidine; Preparation of acyl derivatives of —. (P) Bergell 1115

Phenol; Action of — on the surface tension of albumin solutions. Berczeller 884
bases. Von Braun 332
with calcium hydroxide; Compounds of —. Seliwanoff 1198
Determination of — in presence of hexamethylenetetramine and formaldehyde. Redman and others 346
and formaldehyde; Manufacture of an anhydrous reaction product of —. (P) Wiechmann, and Fenoform Corporation 92
and formaldehyde; Manufacture of condensation products of —. (P) Stockhausen Kautschukwerke 93
with formaldehyde, etc.; Manufacture of condensation products from —. (P) Tarassoff 557
homologues halogenated in the side chain; Preparation of esters of —. (P) Schmitz und Co. 767, 943r

Phenolcarboxylic acids and their derivatives; Preparation of sulphochlorides of —. (P) Bayer und Co. 194r, 221r

Phenol-o-carboxylic acids and their derivatives; Manufacture of nitrosulphochlorides of —. (P) Bayer und Co. 855

Phenol ethers; Combination of — with diazo compounds. Meyer and others 687

Phenolic condensation products; Manufacture of —. (P) Aylsworth, and Condensite Co. of America 931, 931, 1063
condensation products; Process of comminuting —. (P) Aylsworth 557

Phenolphthalein; Constitution of the coloured salts of —. Oddo 414
Determination of —. Mirkin 888

Phenols; Characterisation of — by uranium salts. Aloy and Rabaut 885
Colour reactions of the —:
Carrancio and Gomez 1228
Del Campo 1229
Combination of — with diazo-compounds. Meyer and others 687
Effects of various factors on the germicidal and protein-precipitating powers of the —. Cooper 662
Electrochemical oxidation of —. Fichter and Stocker 755
and formaldehyde; Manufacture of condensation products from —. (P) Stockhausen and Gruhl.... 799
Manufacture of solid condensation products from di- or trihydric — or their derivatives. (P) Labbé.. 974
of peat tar; The —. Börnstein and Bernstein 245
Preparation of di- and polyhydric — and their substitution products. (P) Boehringer und Söhne.... 246
Manufacture of polyvalent — from the corresponding aromatic chlorohydrocarbons. (P) Torley and Matter 347
Synthesis of higher —. Majima and Nakamura 91
from tar oils; Process and means for obtaining —. (P) Pepper 955
with unsaturated side chains; Catalytic hydrogenation of —. Ipatiew 17

Phenoxides; Reaction of alkali — with alkali sulphonates by dry distillation. Nollau and Daniels 984

Phenylacetaldehyde and its derivatives; Method of preparing —. Jehl. Report by Noelting 333

Phenylalanine; Detection of —. Chelle 1074

Phenyl-αβ-dibromopropionic acid ethyl ester; Preparation of stable —. (P) Merck 503

Phenylglycin; Conversion of — into indoxyl by alkali fusion. Feuchter 414

Phenylglyoxal; Formation of benzoylcarbinol and other substances by the action of fermenting yeast on —. Dakin 706

Phenyloxindole. Stollé 827

2-Phenylquinoline-4-carboxylic acid and its derivatives; Manufacture of sulphonic acids of —. (P) Chem. Fabr. vorm. Schering 42
Glycollic acid esters of —. (P) Chem. Fabr. vorm. Schering 334r
and its homologues; Preparation of esters of —. (P) Bayer und Co. 103

Philippine Islands; Mineral output of the — in 1913.... 834
Portland cement raw materials; Burning tests of —. West and Cox 832

Philippines; Oil-nut from the —. The coconut oil industry 556

Phlobaphenes and reactions of hydrolysis (photolysis). Sommerhoff 493
Rendering — soluble by hydrolysis with sulphurous acid. Sommerhoff 152

Phosgene; Action of — on natural phosphates and silicates. Barlot and Chauvenet 21
Action of — on phosphates and oxides. Riban.... 74

Phosphate in basic slag; The Wagner test as a measure of the availability of —. Jones 760
baths used in weighting silk; Removal of tin from —. (P) Meili, and Weidmann Silk Dyeing Co. 589
deposit in Chile 749
fertilisers; Manufacture of —. (P) Dickson 1067
industry of Egypt 1022
of lime; Treatment of —. (P) Ciselet and Noblet.. 77r
rock in the United States; Reserve supply of —. Waggaman 704
slag; Conversion of all the phosphorus into citrate-soluble, fluid — in making steel in the open-hearth furnace. (P) Deutsch-Luxembergische Bergwerks- u. Hütten-A.-G. 600
slag; Treatment of — for agricultural purposes. (P) Küppers, and A.-G. Peiner Walzwerk 704

Phosphates; Action of phosgene on —. Riban........ 74
Action of phosgene on natural —. Barlot and Chauvenet 21
Alcohol in the manufacture of —. Fox 1046
Conversion of — into citric acid-soluble products. (P) Lothringer Portlandzementwerke 35
Fertilising experiments with crude —. Prianischnikow 1101
Manufacture of —. (P) Washburn 789
Preparation of assimilable —. (P) Ciselet, Deguide, and Becquevort 976, 976r
Process for decomposing radioactive —. (P) Ebler 789
Process for rendering soluble insoluble —. (P) Landis, and American Cyanamid Co. 878
in soil extracts; Determination of —. Prescott.... 655
Solubility of mineral — in citric acid. Robertson.. 9
soluble in citric acid; Production of —. (P) Hauck 366

Phosphides of manganese; The higher —. Hilpert.... 351

Phosphor-bronze; Determination of phosphorus in —. Hagmaier 923

Phosphoric acid; Alcohol in the manufacture of —. Fox 1046
in basic slag; Determination of the citric acid-soluble —. Haussding 1101
of cottonseed meal: The organic —. Anderson.... 371
Determination of inorganic — in presence of phosphoric acid esters. Heubner 713
Determination of — by the Pemberton-Kilgore method. Hibbard 44
in dough, etc.; Rapid determination of —. Sobel.. 1167
Manufacture of —:
(P) Brunschwig 200
(P) Haff and Willson 255
(P) Hechenbleikner, and Southern Electro-Chemical Co. 1088
in monazite; Determination of —. Johnstone.... 56
Process and apparatus for making — and its compounds. (P) Washburn 789
Production of available —. (P) Landis, and American Cyanamid Co. 606
in soils; Determination of —. Hornberger........ 432
Ternary systems of — with potassium or ammonia and water. Parker 1086

Phosphoric acid compound of wheat bran; The organic —. Anderson 936
ester of carbohydrates; Process for preparing —. (P) Carlson 103r

Phosphorus; Biochemical significance of —. Kincaid .. 937
Formation of red — by oxidation of phosphorus vapour. Kohlschütter and Frumkin 549
in iron and steel; Determination of —. Phillips.. 423
Modifications of —. Stock and Stamm 22
in phosphor-bronze; Determination of —. Hagmaier 923
Precipitation of metals from solutions of their salts by means of yellow —. Bird and Diggs 787
Production of stable mixtures containing elementary —. (P) Goldstein 201
Two new modifications of —. Bridgman 787
in Scheelite concentrates; Determination of —. Hagmaier 1055
vapour; Transformations of — by the silent electric discharge. Kohlschütter and Frumkin 255

Phosphorus and arsenic; Preparation of organic compounds of —. (P) Meister, Lucius, und Brüning 375, 438
compounds; Hydrolysis of organic — by dilute acid and dilute alkali. Plimmer 664
pentachloride; Manufacture of —. (P) Peacock 256, 354r
pentoxide; Process for hydrating —. (P) Peacock, and International Agricultural Corporation 484

Photographic colour processes. (P) Fox and others 1227
developers:
(P) Act.-Ges. f. Anilinfabr. 440
(P) Vidal 986
developers; Index list of trade names of some — ... 1028
developers; Preparation of —. (P) Union Photographique Industrielle Lumière et Jougla 986, 986r
developers; Use of aldehyde- and acetone-bisulphites of organic bases as —. Pellizzari 1075
developing agents 985

  - tartrate from wine lees; Extraction of ——. (P) Gladysz 200
  - tetroxide. De Forcrand 419
  - trioxide. De Forcrand 481
  - xanthate; Volumetric determination of ——. Holmberg 45
- Potatoes; Production of dried ——. (P) Warth 842
  - Treatment of ——. (P) Enders 563
- Potter's glaze, slip, etc.; Apparatus for sifting and separating ——. (P) Beardmore and others 694
  - materials; Extraction of iron from —— by means of magnets. Thompson 257
- Pottery body material; Talc as a ——. Parmelee and Baldwin 79
  - glazes; Some cobalt-uranium colours for ——. Radcliffe 1050
  - glazes; Production of white and coloured ——. (P) Völkel 137
  - kiln; Present status of the producer-gas fired continuous —— in America. McElroy and Mumma 1051
  - kilns. (P) Dressler 486*r*, 540, 921*r*, 1155*r*
  - Magnetic ——. Mellor 257
  - plaster; The transverse test applied to ——. Allen 1049
  - Production of a material similar to —— from furnace slag. (P) Chiapponi 594*r*
  - Production of translucent designs or ornaments on ——. (P) Greifelt 921
  - Reduction of ferric oxide used as a colouring agent in ——. Kinnison 1049
  - scrap clay; The restoration of plasticity to ——. Minneman 1049
  - slip and glaze; Influence of soluble salts in clay upon the behaviour of ——. Coats 1050
  - Use of gold in ——. Granger 693
  - ware; Method of testing delayed crazing of white ——. Harkort 80
- Pouring wet, adhesive masses into drying pans, etc.; Apparatus for ——. (P) Act.-Ges. f. Anilinfabr. 583
- Powder; Black —— glazed with aluminium. (P) Sparre, and Du Pont Powder Co. 1227
  - Smokeless ——. (P) Guiguet 376
- Powdered substances; Apparatus for taking samples of ——. (P) Roberts 539
- Powders, smokeless; Experiments on the ignition of large quantities of —— at Schlüsselberg. Saposchnikow 668
  - smokeless; Manufacture of ——. (P) Claessen 614
  - smokeless, with a nitrocellulose base; Manufacture of ——. (P) Joliot 987
- Power costs in chemical works. Wollaston 293
  - production from gas engines. Utilisation of waste fuels. Coster 1193
  - from spent tan. Parker 704
- Precipitates; Device for freeing —— from mother liquor when filtering by suction. Gortner 987
  - Machine for washing ——. (P) Elson 809
- Prediction in chemistry. Potts 392
- Preservatives; Chemical ——. Serger 882
  - for raw, fresh, or green foods. (P) Rosenbaum 274
- Preserving preparations. (P) Schoeller and others 364*r*
- Presidential address. Crookes 720
- Press-filters for seeds containing oil. (P) Harburger Eisen- u. Bronzewerke A.-G. 702
- Presses for extracting grease and other material. (P) Mays and others 1215
  - Hydraulic —— for seeds and the like. (P) Harburger Eisen- u. Bronzewerke A.-G., and Koeber 702
  - for oleaginous seeds, etc.; Preventing shaking and jarring in —— during discharge of the oil-cakes. (P) Harburger Eisen- u. Bronzewerke A.-G. 973
- Pressure of liquid mixtures; Rapid method of measuring the partial ——. Rosanoff and others 1027
- Priming charge. (P) Buell, and Winchester Repeating Arms Co. 944
  - compositions; Explosive ——. (P) Claessen 335*r*
- Printed pieces; Drying of ——. Koechlin frères 309
- Printing alizarin; Use of esters of high mol. wt. for ——. (P) Mollard et Cumet 641
  - Application of "col marin" to cotton fibre by ——. (P) Louppe et fils 480
  - Application of glycollic acid in ——. Diehl 417
  - Application of Naphthol AS in ——. Kunert and Acker 479
  - Application of sodium perborate in ——. Trepka 786
  - calico; Use of Naphthol AS (2.3-hydroxynaphthoic anilide) in ——. Lomanowitsch 1203
  - Colour ——:
    - (P) Rheinberg and Rheinberg 1116
    - (P) Turkin 747
  - colours. (P) Schütze and Fischer 642*r*
  - colours; Manufacture of ——. (P) Turkin 757, 838*r*
  - colours; Preparation of gelatin ——. (P) Charles 1021, 1021

Printing—*cont.*
on cotton; Process for ——. Dosne. Report by Schmid 689
Discharge —— on indigo with hydrosulphite, and without steaming. Coloured discharge printing with diazo compounds and vat dyestuffs. Juteau 859
on fabrics; Process for ——:
(P) Gross 547, 917*r*
(P) Meister, Lucius, und Brüning 829*r*
New fixing agent for use in ——. Baumann and others 479
gallocyanine dyestuffs on cotton; Resist method of ——. (P) Durand, Huguenin und Co. 418, 612*r*
ink; Manufacture of ——:
(P) Sureties 798
(P) Wolff 267*r*, 557*r*
inks; Composition of ——. (P) Heyl and Baker 604
machines for textiles, paper, and other fabrics. (P) Elsässische Maschinenbau-Ges. 917
with naphthazarin derivatives. (P) Soc. of Chem. Industry in Basle 197, 590*r*
plate. (P) Aylsworth, and Condensite Co. of America 786*r*
Process for ——. (P) Bayer und Co. 74*r*
sarees, scarves, shawls, etc.; Machines for ——. (P) Calico Printers' Assoc., and Muir 309, 480
textile fabrics. (P) Levinstein, and Levinstein, Ltd. 73, 350, 590*r*
Use of 2-hydroxy-1-naphthoic acid in ——. Heilmann et Cie., and Battegay 860
viscose on textile fabrics. (P) Fourneaux, and Calico Printers' Assoc., Ltd. 350*r*
Prints; Fast steam grey —— Justin-Mueller. Report by Favre 689
Production of fast brown or grey —— on vegetable fibres. (P) Meister, Lucius, und Brüning 480, 642
Production of fast coloured ——. (P) Levinstein, and Levinstein, Ltd. 309, 917*r*
Production of fast —— by means of reduction dyestuffs. (P) Gross 547, 917*r*
on textile fibres; Process for producing fast ——. Levinstein 573
Propane; Properties of pure ——. Timmermans 438
C-Propenylphenolcarboxylic acids and their nucleus-substitution products; Preparation of ——. (P) Claisen 277
Propylene from acetylene and methane; Production of ——. (P) Heinemann 767
Protective covering to be used as paint. (P) Williams and Hayes 33
Protein ammonia; Determination of —— in drinking water, etc. Winkler 804
compounds from fish; Manufacture of soluble ——:
(P) Adler and others 763*r*
(P) Naaml. Vennootsch. Algem. Exploitatie Maatschappij 215
-containing substances; Preparation of plastic materials from ——. (P) Dodd and Humphries 841
metabolism of yeasts and mould fungi; Recent investigations on the ——. Ehrlich 879
substances of yeast; Relation of the —— to sucrase. Thomas 707
Proteins; Chemical action of quinone on ——. Cooper........ 662
Effects of various factors on the power of phenols to precipitate ——. Cooper 662
Influence of artificial organic dyes on the enzymic hydrolysis of ——. Damianovich and Guglialmelli 763
Influence of certain non-electrolytes on the swelling of ——. Fischer and Sykes 932
of the maize kernel; Nutritive properties of the ——. Osborne and Mendel........ 708
Methylation of —— by diazomethane. Herzig and Landsteiner 571
in milk; Decomposition of —— by the action of lactic ferments. De Graaff and Schaap 156
Process for dissolving —— rapidly. (P) Contant and Perrot........ 877
in wheat flour; Determination of the salt-soluble ——. Olson 370
of wheat and rye; Physico-chemical properties of the ——. Groh and Freidl 882
Proteolytic enzymes; Contribution to the chemistry of ——. Herzfeld 707
Prussian blue; Constitution of ——. Woringer 148
Determination of —— in textile fibres. Williams and Dreaper 589
in tea; Determination of ——. Knight 1167
Pseudo-ephedrine. Schmidt 664
Pseudo-tannins in sulphite cellulose extract. Moeller 654
Pseudotsuga taxifolia Britt.; Oil from the leaves of ——. Schorger........ 41
Psycotrine in true ipecacuanha root. Hesse 611
Pulp; Apparatus for concentrating, washing, or bleaching cellulose ——. (P) Gunn 308
Apparatus for drying ——. (P) Coe 72
from aspen; Effect of varying certain cooking conditions in producing soda ——. Surface 1151
chests and the regulation of pulp. Janata 1202
digestion liquor; Process of treating sulphite ——. (P) Grothe 349
The bleaching of chemical —— with suggestions for a standard method. Baker and Jennison 284*r*

PAGE

Pulp—*cont.*
The grinding of spruce for mechanical ——. Thickens 1202
industry; Progress in the chemical ——. Klein 1201
Machine for washing ——. (P) Schneible 1041
for making paper; Method and means for bleaching ——. (P) Couper 478
manufacture; Notes on sulphite ——. Frohberg 857
Manufacture of sulphite ——. Kuhn 744
mills; Apparatus for clarifying waste waters of ——. (P) Mann und Co. 478
-mixing chests and the like. (P) Milne 1085
Preparation of ——. (P) Bache-Wüg 196, 417*r*
Process and apparatus for thickening and agitating ——. (P) Dorr 950
from resinous woods; Manufacture of sulphite ——. (P) Carr........ 417
stuff; Apparatus for refining —— for use in making paper. (P) Nash........ 640
sulphite; Reclaiming waste products in the manufacture of ——. (P) Moore and Wolf 1006
sulphite-, spent lyes; Preparation of a binding and impregnating substance from ——. (P) Pollacsek 248
sulphite-, waste lyes; Disposal of ——. Lassar-Cohn 639
Use of seleniferous pyrites in the manufacture of sulphite ——. Torgersen and Bay 545
wood; Balsam fir as a —— 745
Pulping engines. (P) Marx 1006
machine. (P) Jackson 132*r*
Pulps; Apparatus for agitating and aerating ——. (P) Howard, and Minerals Separation, Ltd. 127*r*
Apparatus for thickening ——:
(P) Lowden, and Colorado Iron Works Co. 780
(P) Rothwell, and Colorado Iron Works Co. 780
Pulpy materials; Machine for drying ——. (P) Sherwin-Williams Co. 849
Pulverisers. (P) Blake Crusher and Pulveriser Co. 633
Pulverising machine. (P) Jackson 132*r*
mills:
(P) Allen and Co., Ltd., and others 126
(P) Kniskern 907
mills; Roller and ring ——. (P) Gebr. Pfeiffer .. 241, 408
ores, etc.; Mills for ——. (P) King, and Head, Wrightson, and Co., Ltd. 319
Pulverulent materials; Preparation of —— for moulding and briquetting. (P) Zwoyer, and Zwoyer Fuel Co. 243
Pump for lixiviating, souring, and washing wool. (P) Bernhardt 197
Pumping apparatus for making long pipes, etc., from molten metals or alloys. (P) Debange 320, 425
liquids; Means for collecting and discharging solid matter when ——. (P) Pennell and Orten-Boving 1221
liquids; Method and apparatus for ——. (P) Mellis .. 408
solutions of cellulose or the like; Apparatus for ——. (P) Criggal 477
Pumps; "Mammoth" —— for mixing and conveying slurry. Steen 866
Process for protecting —— from ozone. (P) Knips, and Siemens und Halske A.-G. 980
Use of "mammoth" —— in chemical industry. Meerbach 301
Pure substances; Utilisation of diffusion processes in preparing ——. Johnston 134
Purging nut (*Jatropha curcas*) seeds; Toxicity of ——. Felke 651
Purifying apparatus. (P) Miguet 65
liquids, semi-liquids, and gases; Process for ——. (P) Marcus 188, 583*r*
substances only slightly soluble in water; Process and apparatus for ——. (P) Rousseau 633
Purine bases; Synthetic glucosides of the ——. Fischer and Helferich 217
1.2.4-Purpurin-3-carboxylic acid; Preparation of ——. (P) Bayer und Co. 545, 784*r*, 828*r*
Purpurogallin. Herzig 413
Preparation of ——. Graebe 246
Yield of —— by oxidising pyrogallol with peroxydase and hydrogen peroxide. Bach 855
Putrefaction; Utilisation of the phenomena of ——, with special reference to sewage sludge disposal. O'Shaughnessy 3
Pyrazolone series; Preparation of mercury compounds of the ——. (P) Givandau and Scheitlin 43, 43*r*
Pyrene; Synthesis of ——. Freund and Fleischer 18
Pyridine; Compounds of zirconium chloride with ——. Chauvenet 135
Determination of ——. Malatesta and Germain 1198
Manufacture of ——. (P) Heinemann 889
Pyridinecarboxylic acids; Manufacture of ——. (P) Heinemann 889
Pyridone dyestuffs; Preparation of ——. (P) Bayer und Co. 415
Pyrites cinder; Process for roasting and sintering ——. (P) Buddeus........ 700
cinder; Production of sintered products rich in iron from ——. (P) Metallbank u. Metallurgische Ges. 143
Determination of carbon in bituminous ——. Lepsöe 134
Determination of sulphur in ——. Martin 252
Extraction of sulphur from iron ——. (P) Hall 77*r*, 485, 485

  Incinerator for town ——. (P) Auvergne 663
  Manufacture of cement and the like from residues obtained in gasifying ——. (P) Elsner 751*r*
  Manufacture of paving or building blocks and iron from domestic and other ——. (P) Becker and Unger .. 647
  material; Apparatus for incinerating ——. (P) Wasley 610
  separator. (P) Kaibel 565*r*
  Treatment of house and town ——. (P) Furse 610
  Treatment of organic ——. (P) Butterfield 804
Reheating furnace; Semi-continuous —— fired with coal or coke. (P) Conor 970
  furnaces. (P) Siemens 144, 321*r*, 836*r*
Rennerfelt electric furnace; The —— 1210
Rennet; Conditions of activity of the enzyme of ——. Michaelis and Mendelssohn 98
Reserve effects on textile fibres; Production of ——. (P) Bentz, and Badische Anilin und Soda Fabrik 747*r*
  effects under vat dyestuffs; Production of coloured ——. (P) Badische Anilin und Soda Fabrik 547
  under zinc dust and stannous chloride discharges. Lehmann. Report by Schmid 641
Reserving gallocyanine dyestuffs and their leuco-compounds on cotton fibre; Process for ——. (P) Durand, Huguenin und Co. 418
Reservoirs; Process for lining ——. (P) Comp. du Ciment-Verre 951
Residual liquors; Furnace for continuous concentration or evaporation of ——. (P) Wolesky and Volesky .. 63
Resin acids; Stability of —— at slightly elevated temperatures. Herty and Cox 973
  of coniferous woods and its removal from sulphite-cellulose. Schwalbe 857
  content of the guayule plant in relation to rainfall. Lloyd 107
  Granulation of ——. (P) Stevens 413, 854*r*
  Manufacture of ——. (P) Aktschourin 838*r*
  and resin soap; Manufacture of ——. (P) Aktschourin 150*r*
  soap; Process for emulsifying —— in water. (P) Dolan 1021
  in sulphite-cellulose 1202
  Vulcanisation of guttapercha ——. Ditmar 799
  from wood; Process for extracting ——. (P) Saylor, and Standard Turpentine and Wood Pulp Co. 92
  Vulcanised glycerol ——. (P) Arsem, and General Electric Co. 94*r*
Resinates; Metallic ——. Ragg 208
  Photochemical properties of coloured ——. Larguier des Bancels 1099
Resinous compositions; Manufacture of ——:
    (P) Aylsworth, and Condensite Co. of America .. 931
    (P) Lilienfeld 430*r*
  compounds; Production of ——. (P) Whipple, and Standard Chemical Co. 150, 150
  condensation products. (P) General Electric Co. .. 325, 931
  condensation products; Manufacture of ——. (P) General Electric Co. 92, 493*r*, 493*r*, 757*r*, 799, 974*r*, 974*r*, 974*r*, 1100
  preparations; Manufacture of adhesive ——. (P) Wolff, and Gebr. Schubert 605*r*
  products; Manufacture of ——. (P) McCoy 653*r*
  products from wood; Process for extracting ——. (P) Soc. Anon. Le Camphre 430
  substances from wood; Apparatus for extracting ——. (P) Waterman 799
Resins in Paleozoic plants and in coals of high rank. White 682
  Synthetic ——. Redman, Weith, and Brock 149
  of tobacco; Chemistry of ——. Von Degrazia 436
  Treatment of gum ——. (P) Raymond 208
  used for embalming in Egypt and Carthage, B.C. 2000—800. Reutter 930
Resistivity of refractories; Measurement of the high-temperature ——. Northrup 264

basic; Determination of the phosphoric acid in —— soluble in citric acid. Haussding 1101
basic; Influence of granular condition of —— on its manurial action. Mikuowski-Pomorski 760
basic; Sources of error in the analysis of ——. Popp.. 704
basic; The Wagner test as a measure of the availability of phosphate in ——. Jones 760
containing phosphoric acid; Increasing the solubility in citric acid of ——. (P) A.-G. Peiner Walzwerk, and Küppers...... 704, 841*r*
Conversion of all the phosphorus into fluid citrate-soluble phosphate —— in making steel in the open-hearth furnace. (P) Deutsch-Luxemburgische Bergwerks- u. Hütten-A.-G. 600
The hydration of blast-furnace ——. Blumenthal...... 964
Influence of alumina on blast-furnace ——. Johnson.. 1094
Manufacture of articles from ——. (P) Chiapponi... 1090*r*
Manufacture of cement from molten blast-furnace ——. (P) Lessing, and Mittelrheinische Cement-Industrie Ges. m. b. H. 1155
Manufacture of light bricks, slabs, blocks, etc., from blast-furnace ——. (P) Schol 356*r*
Manufacture of porous ——. (P) Schol 356*r*
in Portland cement; Determination of blast-furnace ——. Hart 355
Process for granulating molten ——. (P) Façoneisen Walzwerk L. Mannstaedt und Co. 1015
Process for pulverising blast-furnace ——. (P) Bagley and Feilmann 320
Production of a material similar to pottery from furnace ——. (P) Chiapponi 594*r*
Talbot ——. Dafert...... 1066
Treatment of —— for the manufacture of bricks. (P) Sutcliffe 964
Treatment of phosphate —— for agricultural purposes. (P) Küppers, and A.-G. Peiner Walzwerk...... 704
Utilisation of the waste heat of —— 594
Slags; Determination of lime and magnesia in ——. Blum 359
Extraction of useful metals from metallurgical ——. (P) Vuigner...... 206
Magnetite in ——. Bennie 83
from the manufacture of alloys of manganese, silicon, and iron in the electric furnace; Use of —— in making Portland cement. (P) Viélajus...... 422
Process and furnace for obtaining zinc from ——. (P) Uehlendahl 599
Separation and recovery of metals and oxides from molten ——. (P) Desgraz 699
Study of some calcareous and magnesian ——. Bleininger and others 81
Utilisation of the waste heat of —— and apparatus therefor. (P) Semmler 426, 490*r*, 795*r*, 835
Slates; Manufacture of artificial ——. (P) Macdonald and Keswick 1089
Slime cakes; Process of dislodging ——. (P) Shepherd, and Butters Patent Vacuum Filter Co. 632
Separation and purification of ——. (P) Kohn 201
Slimes; Agitating and mixing apparatus for liquid ——. (P) Symmes 30
Agitation of —— for cyanidation. Megraw...... 83
Apparatus for filtering ——:
(P) Butters 781
(P) Stedman, and Butters Patent Vacuum Filter Co. 781
Apparatus for roasting ——. (P) Wales...... 321
Apparatus for separating fine-grained admixtures from ——. (P) Freygang 737*r*
Draining and concentrating coal and other ——. (P) Hunter, and Simon-Carves Bye-Product Coke Oven Construction and Working Co. 410
filter. (P) Alinder, and Allis-Chalmers Manufacturing Co. 187
Filtering —— in cyanidation. Megraw 648
Process for filtering ——. (P) Butters 781
pulp; Filter for ——. (P) Ridgway 836*r*
separators for treating metallurgical and other ——. (P) Hardinge 698
Treatment of metalliferous ——. (P) Kendall 30
Sludge; Apparatus for drying ——. (P) Ogden...... 1221
elevators for mixing and conveying slurry. Steen..... 866
Methods and apparatus for conveying and mixing ——. (P) Polysius 408
from waste waters; Fermentation and mixing of ——. (P) Comp. Claricite 331, 610*r*
Sludges; Composition of sundry sewage ——. Fowler and Clifford 815
Extraction of water from ——. (P) Richter und Richter 663
Filters for ——. (P) Ribbertsche Braunkohlen-, Brikett-, u. Tonwerke 14
Slurry; Methods and apparatus for conveying and mixing ——. (P) Polysius 408

smallpox; Preparation of curative agents for ——. (P) Ponndorf 220
smelter fumes; Apparatus for arresting —— and recovering their values. (P) Vadner 321
  fumes; Device for treating ——. (P) Blom 795
  fumes; Treatment of and recovery of values from ——. (P) Vadner 870
smelters; Fume concentrator for ——. (P) Smith 1059
smelting furnace:
    (P) Riveroll 1014
    (P) Williams and Holdsworth 1014
  furnaces, Cooling lower electrodes of electric ——. (P) Krupp A.-G. 869
  furnaces; Liquid-fuel fired ——. (P) Siegwart and Siegwart 342, 963r
  metals or the like in crucibles. (P) Solomon 31r
  metals, ores, etc.; Apparatus for electrically ——. (P) Guggenheim 426, 490r
  metals; Process of ——. (P) Hilliard, and New England Metal and Machine Co. 31
  ores; Apparatus for ——. (P) Potter 1095
  ores; Furnace for ——. (P) Buchholtz, and Oil-Flame Furnace Co., Ltd. 735r
  process and apparatus; Electric ——. (P) Grabowsky 869
  Tipping furnace for —— heated by liquid fuel. (P) Price 554
  volatile metals; Electrical process for ——. (P) Johnson 86
  works in the United Kingdom. Report by Chief Inspector of Alkali Works 860

Smoke; Apparatus for producing and treating —— for sterilising, etc. (P) Marlow, and Pulsometer Engineering Co. 663
  Apparatus for separating solid matter from ——. (P) Jackson 341, 737r
  The campaign against ——. English and American results 1219
  from furnaces, etc.; Apparatus for treating ——. (P) Thomas, and Smoke Eliminator Synd., Ltd. 65r
  Means for washing ——. (P) Jackson 468
  from metallurgical furnaces; Recent progress in the abatement of ——. Schiffner 1160
  Removal of soot and like material from ——. (P) Bomhard 584
  separator. (P) Holmes and Friebis 64
  Treatment of ——. (P) Burnside and Anderson 1143
  washer. (P) Foster, and American Smoke Washing Co. 636

Soaking pits:
    (P) Siemens 144
    (P) Uehlendahl 144

Soap. (P) Kreutzinger and Juenger 148
  Apparatus for use in making ——. (P) Edwards and Rance 148
  with a basis of petroleum and other hydrocarbons; Manufacture of ——. (P) Cattaert 603
  -boiling trade of Marseilles 874
  Contribution to the knowledge of potassium ——. Kurzmann 701
  Detection of silicates in ——. Leitch 1062
  Detection of soluble silicates in —— by aid of sodium chloride. Isnard 362
  Determination of the fatty acid content of ——. Besson 702
  Determination of free caustic alkali in ——:
    Bosshard and Huggenberg 148
    Kling and others 324
  Determination of rosin in ——:
    Leiste and Stiepel 1099
    Wolff and Scholze 363
  containing hydrocarbons; Manufacture of a stable ——. (P) Pleines 557, 1215r
  Increasing the efficacy and hardness of neutral —— by adding hydrocarbons. (P) Pleines 603
  industry; Fatty product for use in the ——. (P) De Baudicour and de la Gabinière 324
  lyes; Determination of glycerol in ——. Tortelli and Ceccherelli 207
  making in Japan 756
  Manufacture of ——:
    (P) Billing 148
    (P) Mowry and others 557
  Manufacture and application of a new ——. (P) Weiss 603
  Manufacture of compact floating ——. (P) Muller 324, 603
  Manufacture of milled ——. (P) Klopfer 266r
  Manufacture of resin ——. (P) Aktschourin 150r
  Manufacture of trimethylamine derivatives for use in making ——. (P) Herzmann 838
  containing mercury; Preparation of ——. (P) Meister, Lucius, und Bruning 557
  Naphthenic acid ——. Davidsohn 67
  powder; Apparatus for use in making ——. (P) Edwards and Rance 148
  Preparation of highly antiseptic, soluble ——. (P) (P) Schulke und Mayr 324
  solutions; Alkalinity and degree of hydrolysis of ——. McBain and Martin 556
  solutions; Effect of resene on the lathering power of ——. Herty and Williard 1162
  solutions; Studies of the constitution of ——. Bunbury and Martin 323
  Treatment of ——. (P) Mowry and Secord 951

PAGE
Soda, ammonia-, process; Another form of the ——. Fedotieff and Koltunoff 252
  ammonia-, process; A new theory of the ——. Mason 481
  caustic; Purification of solutions of —— used in mercerising. (P) Chambers and Hammond 418
  caustic, used in mercerisation; Recovery of the ——. (P) Brachter 180, 860
  lye; Furnace for the continuous evaporation or concentration of ——. (P) Wolesky and Volesky 63
  lye used for mercerising; Cleansing the —— from size etc. (P) Matter 884
  Manufacture of ammonia- ——. (P) Clemm 24r
  recovery plant in soda-cellulose mills. Schroder 744

Sodammonium; Hydrogenation of polycyclic hydrocarbons by ——. Lebeau and Picon .... [illegible]

Sodium amalgam: Action of variously treated waters on ——. Parker 84
  amalgam and water; Influence of ——. Baker and Parker 84
  amalgams; Specific volumes and electrical conductivities of ——. Vanstone 1213
  Electrolytic process and apparatus for making ——. (P) Marguet 359, 927r
  Manufacture of —— and apparatus therefor (P) Swan and Kendall 459
  Manufacture of stable mixtures containing metallic ——. (P) Goldstein 291
  Preparation of ——:
    Neumann 424
    Neumann and Giertsen 263

Sodium acetylsalicylate; Preparation of ——. (P) Wülfing 439, 1036
  alkyl thiosulphates; Action of hydrogen peroxide on ——. Twiss 218
  aluminate solution; Stable ——. (P) Spence, Craig, and Spence and Sons, Ltd. 1153
  -aluminium fluoride and colloidal silicic acid; Simultaneous production of ——. (P) Humann and Teisler 759r
  benzylsulphanilate; Action of —— on vat dyestuffs. Haller 1203
  bichromate; Manufacture of ——. Ulm 917
  bisulphate in a directly calcinable form; Manufacture of ——:
    (P) A.-G. Dynamit Nobel 354r, 485r
    (P) Löffler 865r
  bisulphite; Influence of —— on Portland cement. Luftschitz 25
  bisulphite; Manufacture of ——. (P) Howard 919
  bisulphite; Manufacture of solid ——. (P) Howard .. 290
  bisulphite; Production of stable crystalline ——. (P) Howard 789
  carbonate crystals; Process for producing ——. (P) Spazier 749
  carbonate deposits of Africa; Natural ——. Watson 74
  carbonate deposits in South Africa; Working of ——.. 350
  chloride and lead chloride; Equilibrium between —— in aqueous solution. Demassieux 351
  chloride, potassium nitrate, water; The system ——. Leather and Mukerji 1007
  chloride; Process for decomposing ——. (P) Helbronner 644
  citrate; Comparison of —— with neutral ammonium citrate. Rudnick and others 704
  compounds; Determination of free caustic alkali in commercial ——. Kling and others 324
  compounds; Extraction of —— from silicates containing alkalis. (P) Messerschmitt 422r
  fluoride and aluminium fluoride; Manufacture of a double compound of ——. (P) Humann und Teisler 209
  glycerophosphate; Composition of commercial ——. Umney and Bennett 844
  hydrosulphite; Action of hydrogen sulphide on ——. Sinnatt 590
  hydrosulphite; Process for making —— based on the expansion of liquefied sulphur dioxide. (P) Descamps 750r
  hypochlorite; Apparatus for making ——. (P) Champ 484
  hypoiodite; Use of —— in the determination of aldoses. Bland and Lloyd 948
  iodide solution; Solubility of iodine in ——. Gill 254
  naphthenate. Davidsohn 67
  nitrate and calcium cyanamide; Fertilising effect of a mixture of ——. Bolin 1216
  nitrate industry of Chile 76
  nitrate production in Chile 749
  nitrate; Shipments and consumption of —— from 1911 to 1913. Montgomery and Co. 79
  nitrate; Winter spraying of fruit trees with ——. Ballard and Volck 432
  perborate; Application of —— in printing. Trepka .. 786
  perborate in bleaching; Value of ——. Kind 1152
  perborate; Decomposition of —— in alkaline solutions. Schenck and others 592
  perborate; Stabilised ——. (P) Kemmerich 789
  peroxide for bleaching rag half-stuffs; Suitability of ——. Von Possanner 1151
  phosphate; Reduction of di- —— by alternating electric currents. Wenger and Heinen 690
  polysulphides. Rnje and Thomas 198

Sodium—*cont.*
  - salts; Effect of manuring with —— on the composition and yield of plants. Rhode Island Experiment Station Report 1022
  - salts and potassium salts; Electrolysis of fused mixtures of ——. Neumann and Bergve 596
  - salts; Process for separating —— from potassium salts. (P) Bassett, and Spar Chemical Co. 484
  - salts; Purification of —— for electrolytic purposes. (P) Von Kügelgen and others 601
  - salts; Recovery of —— from mixtures with potassium salts. (P) Dolbear and Merrill 483
  - silicates; Crystalline ——: their preparation and properties. Morey 253
  - silicates; Crystallised ——. Jordis 863
  - sulphate; Effect of —— on the growth of plants. Haselhoff 95
  - sulphate and phosphate; Commercial standards for dried ——. Umney and Bennett 829
  - sulphate solutions; Action of —— on wool. Fort 689
  - sulphide in a standing sulphide dye-bath; Rapid determination of ——. Len 916
  - telluride and selenide; Preparation of ——. Tschugaeff and Chlopin 548

Soil acidity; Influence of sulphur on ——. Lint 975
  - carbonates; Determination of ——. Hutchinson and MacLennan 1065
  - constituents; Assimilation of —— by oats. Paterson and Scott 1021
  - constituents; Relative solubility of ——. Fischer 1100
  - Electrical method of determining salt in ——. Beam and Freak 1065
  - extracts; Determination of carbon in ——. Ames and Gaither 800
  - extracts; Determination of phosphates in ——. Prescott 655
  - Influence of sulphur, sulphites, and thiosulphates in —— on plant-growth. Thalau 655
  - micro-organisms; Action of mineral fertilisers on some ——. Lumia 759
  - Movements of manures in the ——. Lefèvre 1164
  - Relation of certain plants to the formation of nitrates in ——. Lyon and Bizzell 1021
  - solution and the mineral constituents of the soil. Hall and others 1064
  - Sterilisation of —— 1021
  - Sterilisation of ——. (P) Holmes 1101
  - sterility in Java. Ledeboer and Berkhout 1066
  - Studies of an acid —— in Assam. Meggitt 1100

Soils; Acid ——. Daikuhara 877
  - Action of manganese in ——. Skinner and others 560
  - Adsorption phenomena in ——. Harris 559
  - Bacterial action in —— as a function of food concentration and of insoluble organic matter. Rahn 560
  - Determination of carbon in ——. Ames and Gaither 800
  - Determination of humus in heavy clay ——. Beam 153
  - Determination of the lime requirement of ——:
    - Bizzell and Lyon 34
    - Hutchinson and MacLennan 932
    - Moulton and Trowbridge 1066
  - Determination of phosphoric acid in ——. Hornberger 432
  - Determination of the surface of ——. Hanley 210
  - Distribution of certain constituents in the separates of loam ——. Steinkoenig 799
  - Excessive quantities of nitrates in certain Colorado ——. Headden 799
  - Ferrous iron in ——. Morison and Doyne 210
  - Growth of plants in partially sterilised ——. Russell and Petherbridge 560
  - Influence of organic matter on nitrification or denitrification in arable ——:
    - Barthel 759
    - Kossowicz 841
  - Nature and amount of fluctuation of the nitrate content of arable ——. Russell 210
  - Occurrence of aldehydes in garden and field ——. Schreiner and Skinner 975
  - Occurrence and nature of carbonised material in ——. Schreiner and Brown 560
  - Organic nitrogen of Hawaiian ——. Kelley and Thompson 270
  - Origin of vanillin in ——. Sullivan 1164
  - Presence of some benzene derivatives in ——. Shorey 432
  - Process for making —— impervious. (P) Abraham 933
  - Relative effect of lime as oxide and carbonate on certain ——. Hutchinson and MacLennan 1065
  - Selective adsorption by ——. Parker 210
  - Solution and precipitation of iron in the formation of iron pan in ——. Morison and Sothers 210
  - Volatilisation of ammonia from ——. Lemmermann and Fresenius 1100

Solanum angustifolium; Constituents of ——. Isolation of a new gluco-alkaloid. Tutin and Clewer 435

Solder. (P) Wilkins and Morris 86
  - Aluminium ——. (P) Bailey, and Navaltum, Ltd. 30
  - for aluminium and other metals. (P) Koenig 599
  - Determination of small quantities of lead in ——. Breteau and Fleury 1012
  - Manufacture of soft ——. (P) Dwyer 970*r*

Soldering alloy. (P) Long and Rapp 970
  - composition. (P) Richardson and Richardson 86
  - copper or nickel; Process for ——. (P) Autogenwerk Sirius 205
  - Preparation of electrodes for electric ——. (P) Kjellberg 1162*r*
  - Process of mixed ——. (P) Chameroy 968

Sole leather; Bleaching of ——. Sprague 1164

Solid materials; Recovery of finely divided —— suspended in air or other fluid. (P) Merrell-Soule Co. 1024
  - matter; Means for collecting and discharging —— when pumping liquids such as sewage. (P) Pennell and Orten-Boving 1221
  - substances from liquids; Process and apparatus for separating ——. (P) Hencke 302

Solidonia, a bast fibre. Werner 957

Solids; Apparatus for obtaining gases from ——. (P) Weston 24, 485*r*
  - Apparatus for separating liquid from ——. (P) Colburn 1081
  - Determination of the density of ——. (P) Kalähne 163
  - and gases; Process and apparatus for effecting reactions between —— at high temperatures:
    - (P) Aluminium-Industrie A.-G. 736
    - (P) Dreaper 788
  - and liquids; Centrifugal treatment of mixtures of ——. (P) Bromet and others 1111
  - from liquids; Process and apparatus for separating suspended ——. (P) Jarraud 65
  - from liquids; Process for obtaining ——. (P) Merrell, and Merrell-Soule Co. 850
  - Process for separating —— from liquids and washing them. (P) Berrigan and others 342
  - Recovery of the separating liquid from separated ——. (P) Du Pont and others 65*r*
  - suspended or combined in fumes; Extraction of ——. (P) Armstrong 186
  - suspended in liquids; Extraction of —— in the form of mud. (P) Hertenbein 540
  - in suspension or solution; Process and apparatus for drying ——. (P) Beeton 188*r*

Solubility determination at high temperatures; Method of ——. Tschugaeff and Chlopin 1173

Solutions; Apparatus for making and filtering ——, for use in extracting metals from ores, etc. (P) Isherwood 793, 1016*r*
  - of organic compounds producing emulsions with water; Liquid or solid ——. (P) Vidal 91*r*

Solvents for cellulose; Preparation of ——. (P) Wassermann 785
  - for difficultly-soluble compounds in organismal concretions. (P) Luckow 221*r*
  - for fats; Separation of the vapours of ——. (P) Bodin, Dupont, and Riom 91
  - Manufacture of organic ——:
    - (P) Du Pont de Nemours Powder Co. 278*r*, 502
    - (P) Helbronner and Criquebeuf 502
  - for use in preparing lacquers; Lactic esters as ——. (P) Chem. Werke vorm. Dr. H. Byk 557
  - Production of —— by means of halogen compounds. (P) Masland, and Du Pont de Nemours Powder Co. 219
  - from rubber, caoutchouc, etc.; Recovery of the ——. (P) Boecler 703
  - used in the manufacture of plastic materials; Recovery of volatile ——. Barthélemy 915

Soot-fall study in Pittsburgh. O'Connor 499
  - Products isolated from ——. Knecht and Hibbert 303

Sorghum; Use of sweet —— as source of sugar or as fodder. Annett 1069

Sorption of acids by wool; Kinetics of the ——. Von Georgievics and Dietl 746

Soup; Manufacture of a solution of substances with the odour and taste of ——. (P) Andernacher Dörrgemüse u. Conserven-Fabr. Luithlen u. Naumann. . 274*r*

Souring textiles; Use of boric acid for ——. Weiss. Report by Stricker 641

South Africa; Investigations of the white wines of ——. An œnological study. Brown 762
  - Mineral industry of —— in 1913 1056
  - New Customs Tariff and Regulations of the Union of ——, 1914 846
  - Report on petroleum prospects in the Union of ——. Craig 343
  - Tin resources of —— 1054
  - Union of; Annual Report of the Chief Inspector of Explosives for the ——. Denne 943
  - Union of. Definition of adulterated or loaded feather. . 759
  - Working of sodium carbonate deposits in —— 350

South Australia; Magnesite discovery in —— 591

Southern Rhodesia; Proposed new Customs Tariff of —— for 1914 .... 1174*r*

Soya bean and oil trade of Dairen 756
  - bean oil; Hardened ——. Mellana 701
  - beans; Manufacture of alimentary products from ——. (P) Gössel 99*r*
  - beans; Plastic material from —— for finishing, spinning, and weaving. (P) Contant and Perrot 20, 958
  - beans; Preparation of an agent for decolorising and clarifying tannin and dyestuff extracts from ——. (P) Dammer 840

- from molasses; Manufacture of ——. (P) Grüntzdörffer and List 36, 607*r*
- Nipa palm as a commercial source of ——. Pratt, Williams, and Gibbs 656
- for preserving meat and other food products; Use of ——. Vasseux 38
- Process for bleaching ——:
  - (P) Barrios 1217*r*
  - (P) Larrondo 212
- Process for refining ——. (P) Kremers 977
- production of Argentina in 1913 933
- Production of beet ——. Taylor 1067
- recovery; Battelle process of ——. Norris 154
- refinery waste for making Portland cement; Utilisation of ——. (P) Soc. Anon. des Etabl. Maguin .. 27, 355
- refractometer for determining apparent dry substance of juices and syrups. Schönrock 154
- Rôle of magnesia in the carbonatation process of making white ——. Harloff 154
- solutions; Clarification of ——. (P) Köpke, and Köpke Clarifier Co. 841
- solutions; Electrolytic apparatus for clarifying ——. (P) McCubbin 211
- solutions; Process and apparatus for clarifying ——. (P) Köpke Clarifier Co., Ltd. 1023
- solutions: Purification and decolorisation of ——. (P) Tiemann 155, 271*r*
- syrup; Influence of small amounts of ethyl alcohol on the fermentation of cane ——. Cochran and Perkins 272
- Use of sweet jowar (sorghum) as source of commercial ——. Annett 1069
- vacuum pan; Rate of evaporation in a ——. Deerr 606

Sugar-pine; Leaf, twig, and cone oils of the ——. Schorger 1170

Sugars from cellulose; Process for producing ——:
  - (P) Gallagher and Mork 441, 801*r*
  - (P) Standard Alcohol Co. 37*r*
- from cellulosic materials; Production of fermentable ——. (P) Tomlinson 156*r*
- and formaldehyde; Preparations containing ——. (P) Von Wülfing 218
- Production of fermentable ——:
  - (P) Gallagher 658*r*
  - (P) Gallagher and Mork 561
  - (P) Gallagher, and Standard Alcohol Co. 497
  - (P) Gallagher and others 658
  - (P) Standard Alcohol Co. 37*r*, 37*r*
- Fermentation of some —— by means of *Aspergillus glaucus*. Traetta-Mosca 935
- in gingerbread and similar products; Separation and determination of ——. König and Burberg 709
- Production of ——. (P) Duryea 1023
- reducing; Action of alkali carbonates on —— under influence of heat. Pellet 36
- reducing; Behaviour of —— in the manufacture of cane sugar. Pellet 934
- reducing, in cane molasses; Origin of the ——. Pellet 495
- reducing; Determination of —— in the foliage of the beet and cane. Pellet 1102
- reducing; Determination of small quantities of —— in presence of a large proportion of sucrose. Pellet 35
- reducing; Determination of —— in sugar for melting. Muller 494
- Resolution of racemic —— by means of optically active amyl-mercaptan. Votocek and Vesely 607
- Supposed assimilation of —— by yeasts in absence of fermentation. Davis 1068
- Valuation of raw ——. Wiechmann 976

Sulphate furnaces; Scrapers for agitators of ——. (P) Meister, Lucius, and Brüning 23, 485*r*
- liquors; Electrolysis and treatment of ——. (P) Hunt and Gidden 692, 692, 962*r*

PAGE
Sulphates ; Action of chloroform on metallic ——. Conduché 590
  Determination of sulphur in soluble —— in presence of sodium salts, by the barium sulphate method. Turner 786
  in flour ; Presence of ——. Cripps and Wright 1069
  Physico-chemical determination of ——. Kling and Lassieur 252
  Reduction of —— to sulphides. (P) Ebler 790
  from sulphites ; Manufacture of sulphur and ——. (P) Bayer und Co. 77*r*, 790*r*, 831*r*
  Volumetric determination of ——. North 690
Sulphazone ; Process for preparing ——. (P) Meister, Lucius, und Brüning 278
Sulphazone sulphonic acids ; Preparation of ——. (P) Meister, Lucius, und Brüning 413
Sulphide dye-bath ; Rapid determination of sodium sulphide in a standing — —. Len 916
Sulphide dyestuffs of the carbazole series ; Preparation of ——. (P) Cassella and Co. 247
  for cotton ; Manufacture of ——. (P) Cassella und Co. 19*r*
  for cotton ; Manufacture of yellow and brown ——. (P) Cassella und Co. 348*r*
  Improving the tone of fabrics dyed with black ——. Saget 308
  Manufacture of —— :
    (P) Act.-Ges. f. Anilinfabr. 131*r*, 348*r*, 639*r*, 743*r*, 743*r*, 784*r*, 856*r*
    (P) Badische Anilin und Soda Fabrik 306
    (P) Bayer und Co. 19*r*, 71*r*, 71*r*, 71*r*, 71*r*, 71*r*, 71*r*, 545*r*, 1084*r*
    (P) Cassella und Co. 744*r*
    (P) Grälert and others 1200
    (P) Meister, Lucius, und Brüning 131*r*
    (P) Vidal 957
  Manufacture of leuco-alkali preparations of ——. (P) Meister, Lucius, und Brüning 588*r*
  Process for discharging ——. (P) Cassella und Co. 418
  sulphide blacks ; Process for reserving the silk in half-silk goods in dyeing with ——. (P) Farbwerk Mühlheim vorm. A. Leonhardt und Co. 960
Sulphide ores ; Flotation process for concentrating ——. (P) Tellus A.-G. f. Bergbau u. Hüttenind. 698, 793
  ores ; Separation of metallic ——. (P) Lyster 698
  ores ; Treatment of ——. (P) Dekker 30, 599
  ores ; Treatment and separation of complex ——. (P) Forland 490*r*
Sulphides ; Application of the electrical properties of —— in making resistances, etc. (P) Mascarini 872
  Determination of alkali —— in lime liquors. McCandlish and Wilson 606
  Extraction of sulphur from metallic ——. (P) Hall 135, 137*r*, 143, 143, 143
  in lime liquors ; Determination of ——. Blockey and Mehd 269
  Method for separating metallic ——. (P) Bradford 319
  Process for heating by the heat generated in the formation of metallic ——. (P) Lang 346
  Regeneration of alkali or alkaline-earth ——. (P) Wilson 136
  Separation of metallic —— from gangue, and apparatus therefor. (P) Bradford, and Minerals Separation, Ltd. 793
  Separation of ores containing ——. (P) Minerals Separation, Ltd. 320
  Treatment of mixed —— by the Horwood process. Horwood 203
Sulphitation process for clarifying Louisiana cane juices. Cross 656
Sulphite liquor ; Preparation of bleached waste ——. (P) Coughlin and others 1152
  liquor ; Process and apparatus for making ——. (P) Wolf, and Burgess Sulphite Fibre Co. 789
  liquor ; Process for making ——. (P) Moore and Wolf 789
  liquor ; Purification of alcohol made by distilling fermented ——. (P) Ekström 659
  lyes ; Manufacture of a binding or covering medium from waste ——. (P) Müller 478
  lyes ; Manufacture of binding or impregnating substances from waste ——. (P) Pollacsek 248, 746*r*
  lyes ; Method and apparatus for neutralising ——. (P) Ekström 785
  waste ; Use of —— in making varnishes. (P) Coughlin and Kennard 931
Sulphite-quinol solutions ; Oxidation and protection of ——. Pinnow 161
Sulphites ; Absorption spectrum of ——. Wright 43
  Manufacture of ——. (P) Friedrich and Hirsch 422*r*
  Manufacture of reduction products of ——. (P) Chem. Fabr. Griesheim-Elektron 865, 865*r*
  Manufacture of sulphur and sulphates from ——. (P) Bayer und Co. 77*r*, 790*r*
  in soil ; Influence of —— on plant growth. Thalau 655
Sulphocarboxylic anhydrides and their salts ; Preparation of ——. (P) Naaml. Vennootsch. Fabriek van Chem. Producten 219
Sulphochlorides of phenolcarboxylic acids and their derivatives ; Preparation of ——. (P) Bayer und Co. 194*r*, 221*r*
Sulphonal, salol, and β-naphthol ; Incompatibility of ——. Bianchini 612
Sulphonaphthyl-*p*-diamines ; Preparation of aromatic ——. (P) Meister, Lucius, und Brüning 544
Sulphonated oils and fats ; Manufacture of ——. (P) Russ, and Stolle und Kopke 91, 324*r*, 363*r*
Sulphonic acids from crude petroleum hydrocarbons and acid residues ; Separation of ——. (P) Petroff 345*r*
  Electrolytic production of ——. (P) Bayer und Co. 826*r*
  as hydrolytic agents. Armstrong and Worley 960
  Influence of sulphonates on the hydrolytic activity of ——. Armstrong and Worley 960
  Reaction of alkali salts of —— with alkali phenoxides by dry distillation. Nollau and Daniels 984
Sulphophenol-*o*-carboxylic acids ; Production of compounds containing the nucleus of ——. (P) Bayer und Co. 637, 767*r*
Sulpho-telluride gold ore ; Roasting —— at the Kalgurli Gold Mines. Brinsden 202
Sulphur ; Benzoyl peroxide as a reagent for displacing —— in organic compounds. Vanino and Schinner 941
  and calcium hydroxide ; Reaction between —— in aqueous solution. Tartar 351
  in commercial benzol ; Determination of total ——. Schenk 130
  Determination of various forms of combined —— in the same solution. Haywood 99
  Extraction of —— from sulphide ores, etc. (P) Hall, 143, 143, 143,
  Fertilising action of —— :
    De Castella 1101
    Sabaschnikoff 1101
  in honey and other materials containing much sugar ; Determination of ——. Nottbohm and Weinhausen 561
  Influence of —— on soil acidity. Lint 975
  from iron pyrites, etc. : Process for extracting ——. (P) Hall 77*r*, 485, 485
  in iron and steel ; Determination of ——. U.S. Bureau of Standards 139
  in lighting gas ; Removal of the —— and its determination. Anderson 683
  Liver of ; Purchase and use of —— 764
  from metallic sulphides ; Process for extracting ——. (P) Hall 135, 137*r*
  in motor spirits ; Determination of ——. Bradbury and Owen 1001
  New modification of ——. Aten 1087
  ovens in cane sugar manufacture ; Use of washers and coolers with ——, and determination of sulphuric acid in the oven gases. Pellet 1067
  in pig iron and steels ; Colorimetric determination of ——. Misson 551
  and potassium hydroxide ; Reaction between —— in aqueous solutions. Tartar 74
  Preparation of colloidal solutions of —— in glycerol and erythritol or in mixtures of the two. Von Weimarn 1206
  Process for collecting and separating finely divided ——. (P) Hall 359
  Production of ——. (P) Hall 137*r*
  Production of —— by interaction of hydrogen sulphide and sulphur dioxide. (P) Feld 692
  in pyrites ; Determination of ——. Martin 252
  from pyrites ; Recovery of elementary ——. (P) Rigg, and New Jersey Zinc Co. 870
  from pyritic ores ; Recovery of ——. (P) Hall 359
  in rubber ; Determination of ——. Stevens 268
  in rubber ; Determination of the total ——. Utz 208
  in the soil ; Influence of —— on plant growth. Thalau 655
  in soluble sulphates ; Determination of —— by the barium sulphate method, in presence of sodium salts. Turner 786
  solutions and compounds ; The blue colour of ——. Von Weimarn 1118
  in spent oxide ; Determination of ——. Marsden 909
  in spent oxide ; Determination of —— by combustion. Somerville 548
  from sulphites ; Manufacture of sulphates and ——. (P) Bayer und Co. 77*r*, 790*r*, 831*r*
  trade of Sicily 309
  Treatment of materials containing ——. (P) Koppers 643
Sulphur chloride ; Examination of ——. Frank and Marckwald 749
Sulphur compounds ; Action of ozone on inorganic ——. Riesenfeld and Egidius 1046
  compounds of coal ; Oxidation of —— in the bomb calorimeter, and the correction to be applied. Regester 1041
Sulphur dichloride ; Manufacture of ——. (P) Verein Chemischer Fabriken in Mannheim 23
Sulphur dioxide ; Absorption of —— by refined copper. Stahl 1158
  in air ; Determination of minute quantities of ——. Seidell and Meserve 499
  and ammonia ; Products of the interaction of ——. Ogawa and Aoyama 254
  Apparatus for making ——. (P) Jones 961
  -camphor ; The system ——. Bellucci and Grassi 217
  Oxidation of ——. (P) Ellis and others 864
  Production of ——. (P) Moore and Wolf 485
  Production of sulphur from —— by interaction with hydrogen sulphide. (P) Feld 692

PAGE

Sulphuric acid; Action of concentrated —— on iron and steel. Fawsitt and Powell 234
  Action of —— on copper. Cundall 203
  Apparatus for concentrating ——. (P) Bithell and Beck 1207
  Apparatus for the manufacture of fuming ——. (P) Briggs and others 135
  Apparatus for producing —— by the chamber process. (P) General Electric Co. 482, 1088*r*
  apparatus; Structure for carrying the lead chambers or plates of —— (P) Hartmann Ges. 421
  in the atmosphere; Damage caused to vegetation by —— Tatlock and Thomson 610
  from benzol refining; Purification of —— (P) Gasser 587
  chambers; Device for regulating the water spray or steam injected into ——. (P) Santa 199, 485*r*
  Chambers used in the manufacture of —— (P) Mills, Packard, and Packard and Co., Ltd 692, 1047*r*
  Concentration of ——. (P) Carmichael and Guillaume 919
  concentration; Acid-resisting pipes and vessels for use in ——. (P) Strzoda 643
  Concentration of —— in cast iron apparatus. (P) Galizische Karpathen-Petroleum-A.-G., and Gellen 483
  Concentration and distillation of —— and apparatus therefor. (P) Stoffmehl 76
  Construction of lead chambers for the manufacture of ——. (P) Littman 311
  Detection of minute traces of selenious acid in ——. Schmidt 748
  Determination of arsenic in ——. Tarbell 590
  Determination of arsenic in ——. Rapid method. Koelsch 74
  Determination of iron, mercury, and arsenic in ——. Nisjenson 1086
  free from nitric acid and oxides of nitrogen; Preparation of ——. Grégoire 198
  High concentration of ——. (P) Zanner 865*r*
  as a hydrolytic agent. Constitution of sulphuric acid. Armstrong and Worley 960
  Lead chambers; Atomiser for ——. (P) Parent 311
  in leather; Detection of free ——. Paessler 365
  in leather; Free ——:
    Paessler 95
    Moeller 95
  in leather and sulphited extracts. Thuau and Madru 840
  Manufacture of ——:
    (P) Libme, and Grasselli Chemical Co. 919
    (P) Lutjens 830
    (P) Wedge 864, 1008
  Manufacture of —— and apparatus therefor:
    (P) Carmichael and Guillaume 830
    (P) Mackenzie 483
  manufacture; The chamber process of ——. Hempel and others 481
  manufacture; Lead chambers for use in ——:
    (P) Ising 200
    (P) Nemes 593
  manufacture; Norwegian and Spanish pyrites as raw material in ——. Uhlmann 134
  Manufacture of —— from the sulphur compounds of gas. (P) Mackenzie 352
  manufacture: The tower system of —— of the I. Oesterreich. Sodafabrik and K. Opl at Hruschau. Opl 862
  Mechanical precipitation in the determination of ——. Ledoux 335*r*
  and normal sulphate from bisulphate; Process for obtaining ——. (P) Metallbank u. Metallurgische Ges., and Klencke 788
  in oven gases from sulphur ovens in cane sugar manufacture; Determination of ——. Pellet 1067
  Oxidation process for making ——. (P) Ellis and others 864
  Process for concentrating ——. (P) Zanner 201*r*
  Production of —— in the United States in 1913. Phalen 547, 548
  Production of —— at the zinc smelters in Upper Silesia 260
  Solubility of nitrogen in ——. Beckett 630
  Solubility of silica in ——. Wunder and Suleimann .. 279
  from tin-plate works, etc.; Treatment of the waste ——. (P) Anderson 312
  tower processes. Schliebs 863
  Tray or dish for use in the concentration of ——. (P) Beck and Bithell 1207
  Tubular apparatus for concentrating —— by steam heat. (P) Pritchard, and United Alkali Co. 1207
  Water-spraying device for use in making —— in lead chambers. (P) Harkortsche Bergwerke u. Chem. Fabriken zu Schwelm 830
  works in the United Kingdom. Report by Chief Inspector of Alkali Works 861
Sulphuric anhydride; Chief cause of the loss of —— by incinerating substances containing it. O'Sullivan 1076
  Manufacture of —— by the contact process:
    (P) Bayer und Co. 22, 422*r*
    (P) Classen 788
    (P) Von Kéler and others 831*r*
Sulphurous acid; Absorption spectrum of ——. Wright .. 43
  in the air; Damage caused to vegetation by ——. Tatlock and Thomson 610
  Determination of free —— in presence of thiosulphate and of sulphuric acid. Sander 442

Sulphurous acid—*cont.*
  Manufacture of reduction products of ——. (P) Chem. Fabr. Griesheim-Elektron 865, 865*r*
  Volumetric determination of ——. Jamieson 917
  Volumetric determination of free ——. Kedesdy 615
  in wines; Volumetric determination of ——. Ferré .. 880
Sulphurous anhydride in wines; Determination of the total ——. Lévy 37
Sulphurous fumes; Process for destroying ——. (P) Young, and The Thiogen Co. 593*r*
  gases and fumes; Process of arresting and utilising the heat and constituents of ——. (P) Vadner 1015
Sunderite; Composition of —— 103
Superphosphate; Apparatus for use in manufacturing ——. (P) Lynen 560
  Influence of granular condition of —— on its manurial action. Mikuowski-Pomorski 760
  Manufacture of double ——:
    (P) Willson 1217
    (P) Willson and Haff 35, 494*r*
  -vinasse, a new fertiliser. Stoltzenberg 153
Surface-combustion. Bone 303, 909
  Flameless ——. Dobbelstein 409
  Flameless incandescent ——. Gray 682
Surface-tension; Lowering of —— and pharmacological action. Berczeller 886
Surgical products; Manufacture of ——. (P) Von Walther 161*r*
Suspended matter from fluids; Means for removing particles of ——. (P) Strong and others 1193
Swaziland; *Scilla rigidifolia* leaves from —— for paper making 477
Sweden; Tariff treatment of nickel oxide and protoxide in —— 829
Swelling of textile fibres and other solids on immersion in liquid, and its measurement. Justin-Mueller 1201
Sylvestrene; Synthesis of *d*- and *l*- ——. Haworth and Perkin 101
Synthesis; Physico-chemical apparatus for ——. (P) Miguet 65
Syphilis; Manufacture of compounds suitable for use in treating ——. (P) Meister, Lucius, und Brüning 767, 806
Syrup from alfalfa; Manufacture of ——. (P) Rich 935
  Manufacture of table —— in the West Indies. Tempany 327
Syrups; Determination of the viscosity of refined ——. Powell 238
  Process for boiling ——. (P) Gräntzdörffer and List 36, 841*r*
  Product for simultaneously decolorising, defecating, and clarifying ——. (P) Lagrange 878
  Production of ——. (P) Duryea 1023
  Refractometer for determining the apparent dry substance of ——. Schönrock 154

T

Tabbyite of Utah. Bardwell and others 15, 16
Table syrup; Manufacture of —— in the West Indies. Tempany 327
Talbot slag. Dafert 1066
  steel process compared with other open-hearth refining processes. Schuster 551
Talc as a lubricant. Thalberg 702
  as a pottery body material. Parmelee and Baldwin .. 79
Talgol (hardened whale oil). Mellana 701
Tallow in cocoanut oil; Detection of ——. Bömer 323
  Stillingia or Chinese ——. Diedrichs 1098, 1098
Tan liquors; Standard forms for reporting analyses of ——. Alsop 1164
  Power from spent ——. Parker 704
Tanks; Manufacture of ——. (P) Guest and Lenox 999
  Mastic lining for acid —— 420
  Process for lining ——. (P) Comp. du Ciment-Verre.. 951
  for separating combustible liquids and solid matter from waste water. (P) Kützer 565
  Settling ——. (P) Loebel 540
Tannery liquors; Analysis of ——. Bennett 1184
  practice; Application of stearamide as emulsifying agent in the ——. Van Tassel 605
Tannin; Affinity of cotton cellulose treated with nitric acid for ——. Knecht and Lipschitz 121
  of the bark of *Salix alba viminalis*. Powarnin and Schurawlew 558
  and caffeine; Separation of —— in the analysis of tea. Marden 501
  in cider; Determination of ——. Spiers 213

  - oils; Apparatus for distilling ——. (P) Steinschneider 543
  - oils; Extraction of phenols from ——. (P) Pepper .. 955
  - oils; Process for distilling or mixing ——. (P) Steinschneider 413
  - oils; Treatment of ——. (P) Zink 413
  - oils; Use of —— in internal combustion engines. Drexler 1146
  - painting of concrete. Abbott 964
  - and petroleum; Preparation of nitrous products from mixtures of ——. (P) Flexer 17, 347*r*, 742*r*
  - The phenols of peat ——. Börnstein and Bernstein .. 245
  - products in America. Jayne 1178
  - products; Free carbon in —— and its determination. Weiss 474
  - products; German prohibition of exports of —— 915
  - products; German trade with America in coal ——. Hesse 914
  - or its products; Treatment of coal —— to remove the properties tending to induce pitch cancer. (P) Robinson 412, 913*r*
  - Removal of —— from warm distillation gases. (P) Berlin-Anhaltische Maschinenbau A.-G. 245
  - Sale of —— 1150, 1198
  - Separation of acid —— from tar oils or mineral oils. (P) Burkhardt 305
  - or tar oils; Increasing the fungicidal and insecticidal properties of the nitrogenous bases from ——. (P) Chem. Fabr. Flörsheim Dr. H. Noerdlinger 1025
  - or tar oils; Removal of deleterious substances from ——. (P) Ross 742, 1004, 1084*r*
  - Treatment of ——. (P) Steadman 244
  - treatment of roads. Revision of Road Board Specifications 412
  - Use of —— in the production of basic linings of steel furnaces. Wagner 305
  - Use of refined coal —— in the creosoting industry. Von Schrenk and Kammerer 833
  - Vacuum ——. Pictet and Bouvier 70
  - vapours; Manufacture of gas or hydrogen by decomposing ——. (P) Berlin-Anhaltische Maschinenbau A.-G. 190
  - works in the United Kingdom. Report of Chief Inspector of Alkali Works 862
- Taramani seed and its oil 147
- Taranaki oil field; The ——. Watkins 189
- Tarragona port wine. Kickton and Murdfield 658
- Tarring roads; Production of a plastic, rubber-like mass for ——. (P) Soc. Anon. des Combustibles Industriels 18
- Tarry materials; Process for increasing the heat-resisting properties of ——. (P) Zimmer 130*r*
- Tars; Use of —— as fuels 193
- Tartar, cream of; Crystallisation of —— in the fruit of grapes. Alwood 496
  - Manufacture of cream of ——. (P) Cantoni and others 831*r*
- Tartaric acid; Treatment of materials containing —— to produce calcium and potassium tartrates. (P) Gladysz 200
- Tartrates from marcs, wine lees, tartars still crystals, etc., etc.; Recovery of the whole of the ——. (P) Arrivaut and Teyssier 882
- Tea; Apparatus for producing dry extracts of ——. (P) Bray and others 979
  - Determination of Prussian blue in ——. Knight 1167
  - Investigation of the manufacture of ——. Sawamura 882
  - leaf; Panning or roasting and drying —— and apparatus therefor. (P) Sutton 157
  - residues; Defecation and denaturation of ——, and recovery of the active principles. (P) Rousseau .. 882
- Technical Information Bureau of the Imperial Institute .. 1038
- *Telfairia pedata* seed and oil therefrom 147
- Telluric acid; Preparation of —— and a test for associated tellurous acid. Browning and Mining 481

PAGE

- Tellurium: Action of sodium hydrosulphite on ——. Tschugaeff and Chlopin 548
  - as colouring agent in soda-lime silicate glass. Fenaroli 790
  - Gravimetric determination of ——. Gutbier and Huber 713
  - Photographic toning bath containing ——. (P) Chem. Fabr. vorm. Schering 503, 668
  - -silver mineral from Colorado; Empressite, a new ——. Bradley 922
- Tellurium-arsenic compounds; Preparation of organic ——. (P) Meister, Lucius, und Brüning 375
- Tellurium dioxide; Combustion-analysis by means of ——. Glauser 223
- Tellurous acid; Test for associated ——. Browning and Mining 481
- Temiskamite, a new nickel arsenide from Ontario. Walker 261
- Temperature; Device for measuring ——. (P) Mellin 1076
  - scale; Mercury resistance thermometer as a reproducible empirical ——. Jaeger and von Steinwehr 712
- Temperatures, high; Methods of research at ——. The high-temperature microscope. Kittl 104
  - high; Special methods for the production of ——. Tiede and Birnbräuer 753
- Tempering furnace; Semi-continuous —— fired with coal or coke. (P) Conor 970
  - Tunnel kilns or furnaces for ——. (P) Richter 206*r*
- Terbium. James and Bissel 1087
- Terne-coated sheets; Method of sampling and analysing ——. Aupperle 1212
- Terpene by-products in the manufacture of paper pulp. Luttringer 745
  - hydrocarbons; Production of unsaturated ——. (P) Badische Anilin und Soda Fabrik 440
  - hydrocarbons from terpene hydrohalides; Manufacture of ——. (P) Meyer 43*r*
  - peroxide; Preparation of ——. (P) Ramage and others 844, 844
  - series; Manufacture of therapeutically-active esters of the ——. (P) Kalle und Co. 806
- Terpenes; Mechanism of the transformation of —— by means of acids. Francesconi and Sernagiotto 1222
  - Synthetic hydrocarbons allied to ——. Haworth and Fyfe 766
- Terpinene; Formation of ——. Semmler and Jakubowicz 806
- Terracotta bodies, slips, and glazes. Phillips 1050
- Tetrachlorodiaminodiphenylurea; Preparation of ——. (P) Meister, Lucius, und Brüning 221
- 1.2.3.4-Tetrachloroquinizarin. Hövermann 544
- Tetrahydro-acenaphthene; Preparation of —— by means of sodammonium. Lebeau and Picon 913
- Tetrahydro-isoquinoline derivatives; Preparation of ——. (P) Decker 439
- Tetrahydronaphthalene; Preparation of —— by means of sodammonium. Lebeau and Picon 913
- Tetrahydrostrychnine; Some experiments with ——. Leuchs 331
- Tetranitromethane; Colour reactions of organic compounds with ——. Charitschkow 769
  - A reaction of ——. Hodgkinson and Hoare 522
- Tetraphenylethane; Preparation of symmetrical ——. Sabatier and Murat 70
- Tetrazenes; Action of nitrogen peroxide on ——. Wieland and Reisenegger 955
- Texas; Saltpetre in —— 1206
- Textile articles from cellulose solutions or plastic masses; Production of ——. (P) Borzykowski 417
  - goods; The conditioning of ——. (P) Joseph 1152
  - goods; Finishing, filling, loading, and dressing ——. (P) Lilienfeld 747
  - industry; Application of low temperatures in the ——. Erban 1045
  - machinery. Board of Trade Bulletin 1045*r*
  - materials; Apparatus for dyeing, bleaching, centrifuging, and otherwise treating ——. (P) Resch 589
  - materials; Apparatus for treating —— with elastic fluids. (P) Pulsometer Engineering Co., Ltd., and Marlow 546
  - materials; Apparatus for treating —— with liquids. (P) Fulton 134*r*
  - materials; Bleaching, dyeing, oxidising, washing, and drying —— as they are discharged from spinning machines. (P) Grandsire 73*r*
  - materials; Gaseous and like treatment of ——. (P) Brandwood and Brandwood 133, 133, 590*r*, 590*r*
  - piece goods; Machines for treating —— with liquids. (P) Ainley 251, 1085
  - plants; Electrolytic and electrochemical process for degumming ——. (P) Peyvel 858
- Textiles; Apparatus for drying ——. (P) Feuillette, and Soc. Etabl. E. Feuillette 1006
  - Continuous extraction of grease from —— and apparatus therefor. (P) Gohy 546
  - in the form of yarn, etc.; Cleaning, washing, and otherwise treating ——. (P) Larivei 916
  - Loss of colour on storing dyed ——. Heermann 1153
  - Manufacture of preservative paints for ——. (P) Comp. Franç. d'Injection pour la Conservation des Bois et Tissus 876

  - Preparation of finishing materials for —— resistant to water. (P) Watremez 480, 481
  - Rotary apparatus for dyeing and otherwise treating ——. (P) Smith and Drum 547
  - Treatment of —— with alginates made from seaweed. (P) Ingham 689
- Thallium; Extraction of —— from lead ores. (P) Deutsche Felsen Oel Ges. 31*r*, 871*r*
- Thallium nitrite. Ball and Abram 75
- Therapeutic agent; Niton as a ——. Ramsay 666
  - agents in the treatment of tuberculosis and syphilis; Manufacture of compounds suitable as ——. (P) Meister, Lucius, und Brüning 767*r*, 806
  - compounds; Manufacture of ——. (P) Wellcome and Pyman 889
- Thermal processes; Apparatus for carrying out ——. (P) Pollak 188
- Thermocouples for pyrometry. (P) Paul 378
- Thermo-electric element. (P) Marsh, and Hoskins Manufacturing Co. 31
- Thermo-element. (P) Achenbach 1118
- Thermo-elements of precision, especially for calorimetry. White 1116
- Thermometer with automatic setting; Variable zero ——. Féry 614
  - glasses. National Physical Laboratory Report 893
  - Mercury resistance —— as a reproducible empirical temperature scale. Jaeger and von Steinwehr .. 712
- Thermometry; The freezing point of benzene as a fixed point in ——. Richards and Shipley 1036
- Thermo-regulator; Electrical contact vapour-pressure ——. Feild 161
  - for thermostats at temperatures very close to room temperature. Powell 899
- Thermostat for low temperatures. Walton and Judd 1227
- Thiazine dyestuffs; Constitution and colour of ——. Kehrmann and others 687
- Thioindigo dyestuffs in the colloidal condition. (P) Badische Anilin und Soda Fabrik 194
- 2-Thionaphthene-2′-cumarone-indigo. Fries and Bartholomäus 826
- 2-Thionaphthene-2-indole-indigo or its derivatives; Preparation of transformation products of ——. (P) Soc. Chem. Industry in Basle 416
- Thionyl chloride; Manufacture of ——. (P) Bayer und Co. 830, 831
- Thiophen; Chlorination of —— by means of *aqua regia*. Datta and Fernandes 1198
- Thiosulphates; Action of hydrogen peroxide on the sodium alkyl ——. Twiss 218
  - Oxidation of —— by certain bacteria in pure culture. Lockett 610
  - in soil; Influence of —— on plant growth. Thalau .. 655
  - Volumetric determination of —— in presence of sulphites. Bodnàr 21
- Thiosulphuric acid; Reduction of arsenic acid to arsenious acid by ——. Chapin 481
- Thioxanthones of the benzanthrone series; Preparation of ——. (P) Badische Anilin und Soda Fabrik 415
- Thitsi (Burmese lacquer). Rosenthal 703
- Thoria in monazite; Determination of ——. Johnstone .. 55
  - from monazite sand; Extraction of ——. (P) Baskerville, and Welsbach Light Co. 353
- Thorium; The end product of ——. Holmes and Lawson 1206
  - Extraction of salts of mesothorium and radium from minerals containing ——. (P) Deutsche Gasglühlicht A.-G. and others 789
  - Method of obtaining the radioactive matter in solutions containing ——. (P) Glaser and Glaser 256
  - in monazite sand; Determination of ——. Carney and Campbell 691
  - in monazite sand; Distribution of ——. Baltuch and Weissenberger 864
  - Preparation of ——. Lely and Hamburger 649
  - Production of metallic ——. (P) Arsem, and General Electric Co. 264*r*
  - Separation of —— from other rare earths. (P) Knöfler und Co. 23
  - Separation of salts of mesothorium and radium in extraction of —— from minerals. (P) Schwab .. 312
  - Treatment of sulphate mixtures containing ——. (P) Ebler 790
  - -tungsten, a ductile alloy. Von Grotthuss 262
- *meso*-Thorium; Treatment of ores and intermediate products containing ——. (P) Ebler 864, 865*r*
- Thorium D; Volatility of ——. Relative β-activities of thorium C and D. Wood 1206
- Thorium ammonium oxalate. James and others 1008
  - carbide; Composition of the gas produced by the action of water on ——. Lebeau and Damiens 548
  - oxide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
  - salts; Bactericidal and antitoxic action of —— on the cholera vibrio. Frouin and Roudsky 942

Titaniferous iron ore ; Treatment of ——. (P) Rossi, and Titanium Alloy Manufacturing Co. 870
  iron ores ; Smelting of —— in the blast furnace. Simmersbach 486
Titanium alloys ; Manufacture of ——. (P) Kraus, and General Electric Co. 425
  Determination of —— as phosphate. Jamieson and Wrenshall 377
  Effect of —— on the magnetic properties of iron. Applegate 791
  Influence of —— on copper and some of its alloys. Bensel 261
  -iron alloys. Lamort 595
  -iron alloys ; Addition of —— to foundry iron. Braune 1090
  in iron alloys ; Determination of ——. König 315
  in iron and steel ; Colorimetric determination of ——. McCabe 1030
  Preparation of ——. Lely and Hamburger 649
  Preparation of pure ——. Billy 317
  Separation of —— from iron, aluminium, and phosphoric acid by means of "cupferron." Thornton 615
  Use of "cupferron" in the quantitative separation of —— from iron. Thornton 279
  Volumetric determination of —— by means of ferric chloride. Ball and Smith 1036
  Volumetric determination of —— by means of a modified reductor. Van Brunt 808
Titanium carbide ; Manufacture of a compound containing ——. (P) Rossi and others 598
  cyanonitride ; Production of —— (P) Peacock, and Du Pont de Nemours Powder Co. 354*r*
  -halogen compounds from natural double silicates ; Manufacture of ——. (P) Van der Leeden 865, 865*r*
  nitride in steel. Comstock 966
  -oxygen compounds ; Preparation of ——. (P) Farup 920
Titanous chloride ; Manufacture of bleaching solutions containing ——. (P) Rossi, and Titanium Alloy Manufacturing Co. 919
  salts ; Processes for bleaching with solutions of ——. (P) Titanium Alloy Manufacturing Co., and others 73, 73
Tobacco ; Chemistry of ——. The essential oil of tobacco. Halle and Pribram 612
  leaves ; Preparation of artificial —— from tobacco waste. (P) K. K. Oesterr. Tabakregie 572
  leaves ; Process of bleaching ——. (P) Oelenheinz 334
  plants ; Improved yield of nicotine from waste ——. Chuard and Mellet 1071
  Process for treating ——. (P) Gallagher and Miller 43*r*
  resins ; Chemistry of ——. Von Degrazia 436
  Studies on the curing of leaf ——. Garner, Bacon, and Foubert 894
  Treatment of ——. (P) Lawrence and Bahnson 1118
  waste ; Process for preparing nicotine from ——. (P) Halle 221
Toluene ; Chlorination of —— by means of *aqua regia*. Datta and Fernandes 1198
  Manufacture of nitro derivatives of ——. (P) Vergé 890
  Nitro compounds of ——. Will 376
p-Toluoylacetic acid and its *o*-nitro compound. Duff 1004
Tomatoes ; Manufacture of an extract resembling meat extract, from ——. (P) Frerichs 330
Toning bath containing tellurium for photographic silver images. (P) Chem. Fabr. vorm. Schering 503, 668
Tooele, Utah ; Lead matte converting at ——. Kuchs 967
Tool steel ; Analysis of high-speed ——. Fettweis 261
  steel ; High-speed ——:
    (P) Becker 31*r*, 650*r*, 755*r*
    (P) Furness 649
  steel ; Manufacture of extra-rapid ——. (P) Jaboulay 968
  steels ; General properties of ——. Denis 696
Tools ; Moisture in compressed air for pneumatic ——. Hofmann 301
Trade Marks (Temporary) Rules, 1914 813, 814
Trade Marks (Temporary Rules) Act, 1914 813
Trading with the Enemy Act : First application under Sect. 3 1038
Train oil ; Process for deodorising the fatty acids of ——. (P) Hofmann 324, 492*r*
Transformer oils. Brauen 951
Transformers ; Formation of deposits in oil-cooled ——. Michie 1196
Travancore monazite. Johnstone 57
Treasurer of the Society ; Report of the Hon. —— 720
Trehalose ; Extraction of —— from selaginellaceaes. (P) Worms 567
Triaminobenzene-arsinic acid ; Preparation of a ——. (P) Boehringer und Söhne 438
Triaminocarbazolemonosulphonic acid ; Preparation of ——. (P) Cassella und Co. 854
Triaminoguanidine. Pellizzari and Gaiter 941
Triazoles of the aromatic series ; Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron 247, 588*r*
Tri-calcium silicate ; Large crystals of ——. Campbell 964
Trichilia subcordata ; Fat from the seeds of ——. Oestling 147
Trichloro-acetic acid ; Colour reactions of organic compounds with ——. Charitschkow 769
  as a substitute for carbon dioxide snow. Sommer 711

(P) Côte and Pierron 755r
(P) Roitzheim 755r
Extraction of —— from its ores or compounds. (P) Watts 1058
Extraction of —— from ores, especially ores containing lead. (P) Mineral Products, Ltd., and Woltereck 86
Extraction of —— from residues, slags, and low-grade ores, and furnace therefor. (P) Uehlendahl 599
Extraction of —— from solutions of zinc sulphate or other zinc salt. (P) Lance 421
Extraction of —— from zinc ores in a vacuum, and furnace therefor. (P) Herter 86, 555r
furnace; Electric ——. Peterson 357
furnace; Electric —— with integral condenser:
(P) Thierry 1016r
(P) Thomson 86, 319, 425. 426
furnaces; Apparatus for making receivers for ——. (P) Möhring 319
in glass; Presence of traces of ——. Javillier 164
-gold slime; Notes on the treatment of ——. White .. 1091
industry in Upper Silesia 260
-iron alloys. Taboury 922
-lead ores; Apparatus for treating ——. (P) Isherwood 793
-lead sulphides; Treatment of —— by the Horwood process. Horwood 203
Manufacture of ——. (P) De Stucklé 599
Manufacture of pure ——. (P) Speeketer 205
Metallurgy of ——. (P) Queneau, and Queneau Electric Zinc Furnace Co. 1095r
Muffle furnace for producing ——. (P) Koppers and Lengersdorf 870
ores; Apparatus for smelting ——. (P) Potter 1095
ores and compounds; Separation of metals from ——. (P) Ashcroft 426r
ores; Electric furnace for reducing ——. (P) Queneau 1014
ores; Electric resistance furnace for treating ——. (P) Comp. pour le Traitement des Métaux et Minerais par l'Electricité 490r
ores; Plant for the recovery of zinc from ——. (P) Roitzheim 360r
ores; Preparation of very finely divided —— for oil-flotation. (P) Wolf 793
ores; Preparation of zinc sulphate from ——. (P) Araki 484
ores; Process and apparatus for treating ——. (P) Boguski, and Soc. Minière et Industrielle Saturn .. 969
ores; Recovery of heat and the constituents from the sulphurous gases or fumes from ——. (P) Vadner 1015
ores; Reduction of —— in the electric furnace. (P) Johnson 86
ores; Treatment of ——. (P) Bensusan 30
ores or waste; Treatment of ——. (P) Bourgeot 836r
output of the World 1056
Physico-chemical studies on ——. Cohen and Helderman 597
pipes for conveying water; Use of ——. Rinck 883
Polymorphism of ——. Pétrenko 1212
Preventing formation of zinc dust during condensation of ——. (P) Vuigner 205
Process and apparatus for producing ——. (P) Speeketer 755r
Process for precipitating ——. (P) Wilson and Bretherton 143
The recrystallisation of worked ——. Timoféeff 203
residue works in the United Kingdom. Report of Chief Inspector of Alkali Works 862

Zinc—*cont.*
residues; Treatment of ——. (P) Jones, and Bartlesville Zinc Co. 1058
Retort furnaces for use in smelting ——. (P) Londress and Worley 321r
Separation of —— from sulphide ores. (P) Durant, and Metals Extraction Corporation, Ltd. 1058
Separation of —— from sulphide or oxide ores containing copper and lead. (P) Borchers and Menzel 870
Separation of —— by treating a mixture of zinciferous material and fuel with a blast of air. (P) Timm 143, 360r
-silver alloys; Hardness of ——. Pétrenko 1211
-silver alloys quenched and annealed; Electrical conductivity of ——. Pétrenko 1211
-silver-lead alloys; Ternary ——. Bogitch 1092
-silver-lead ores; Treatment of —— by smelting with zinc salts. (P) Langguth 698
smelters in Germany; Working and health conditions of —— 1169
smelting; By-products in electric ——. Johnson 83
sulphide and lead sulphide; Method of separating ——. (P) Bradford 319
sulphide pigments; Rotary tubular kiln for removing the chemically-combined water in ——. (P) Küppers 795
sulphide; Separation of —— from ores. (P) Minerals Separation, Ltd. 320
in treated wood; Determination of ——:
Bedford and Pfanstiel 1053
Frary and Mastin 1089
vapour: Condensation of —— and apparatus therefor. (P) Timm 144r, 206r
vapours; Condenser for ——. (P) Appel 870
vapours; Process for recovering ——. (P) Helfenstein Elektro-Ofen Ges. 969
Velocity of solution of —— in acids. Centnerszwer and Sachs 753
World's production of —— 833
Zinc chloride in treated wood; Determination of the amount of ——. Bateman 138
compounds; Reduction of ——. (P) Cutten 30
lyes; Treatment of ——. (P) Buddeus 644
oxide; Apparatus for making ——. (P) Ferrere 650r
oxide; Manufacture of —— and apparatus therefor. (P) Singmaster, and New Jersey Zinc Co. 1088
oxide; Manufacture of pure ——. (P) De Stucklé .. 599
oxide; The plant of the New Jersey Zinc Co. for making —— 1092
oxide; Preparation of pure —— from crude oxides containing lead. (P) Heimann 484
solutions; Precipitation of iron from ——. (P) Ramén 489r
sulphate liquors; Electrolysis and treatment of ——. (P) Hunt and Gidden 692, 692. 962r
sulphate; Preparation of —— from silicious zinc ores. (P) Araki 484, 831r
white; Manufacture of ——. (P) Cutten 1020
white; Preventing injurious effects of —— on the fastness to light of water colours. Täuber 266
Zircon enamels; Clouding agent for use in making white ——. (P) Verein. Chem. Fabr. Landau, Kreidl, Heller und Co. 314
Zirconates; Synthesis of ——. Pukall 363
Zirconia crucibles. Ruff and Lauschke 647
Zirconium-bronze; Attempts to produce —— electrolytically. Kremann and others 752
lamp-filament. (P) Hansen, and General Electric Co. 193r
Preparation of ——. Lely and Hamburger 649
Separation of —— from aluminium. Ferrari 1228
Separation of —— from iron and aluminium by means of "cupferron." Thornton and Hayden 941
Zirconium chloride; Compounds of —— with pyridine. Chauvenet 135
compounds; Process for weighting silk by means of ——. (P) Stern 1045
dioxide; Production of fireproof articles from ——. Ruff and others 593
hydroxide; Adsorption by ——. Wedekind and Rheinboldt 787
mordants. Wengraf 859
oxide; Behaviour of —— at high temperatures. Tiede and Birnbräuer 754
oxide in enamels for iron; Use of ——. Haber 49
Zymin; Enzymes of washed ——:
Harden and Norris 658
Harden and Zilva 761

LIST OF NEW BOOKS RECEIVED.

PAGE
Agricultural analysis; Principles and practice of ——. Vol. III. Agricultural products. Wiley 224
Alkali, etc., Works Regulation Act, 1906. Report of Chief Inspector for 1913 846
Analysis; Methods of quantitative organic ——. Kingscott and Knight 1077
Analysis; Quantitative ——. Mahin 224
Analysis; Technical methods of chemical ——. Lunge and Keane. Vol. III. 1175
Anorganischen Chemie; Handbuch der Arbeitsmethoden in der ——. Vol. III. Part 1. Stähler 165
Anorganisch-chemische Grossindustrie; Taschenbuch für die ——. Lunge and Berl 224
Asphalte; Die Chemie und Technologie der natürlichen und künstlichen ——. Köhler and Graefe 165
Australasian Institute of Mining Engineers. Vols. XIV., XV. (Parts 1 and 2) and XVI. 106
Bases; The simpler natural ——. Barger 572
Brass-furnace practice in the United States. Gillett 1175
Brennereifragen. Sidersky 572
Brennstoffe; Die flüssigen ——. Donath and Gröger 898
Catalogue of scientific literature; International ——. C. Physics 1175
Chemistry and its borderland. Stewart 336
Classiques de la science. I. L'air, l'acid carbonique, et l'eau (Dumas, Stas, Boussingault). II. Mesure de la vitesse de la lumière. Etude optique des surfaces (Foucault). III. Eau oxygénée et ozone (Thénard, Schoenbein, De Marignac, Soret, Troost, Hautefeuille, Chappuis). IV. Molécules, atoms, et notations chimiques (Gay-Lussac, Avogadro, Ampère, Dumas, Gaudin, Gerhardt) 46
Coconuts; Manurial experiments on ——. De Verteuil 379
Coke; Metallurgical ——. Belden 379
Cyanverbindungen; Die Industrie der ——. Köhler 165
Edelmetallaugerei; Fortschritte der —— während der letzten Jahrzehnte. Borchers 280
Electric furnaces for making iron and steel. Lyon and Keeney 714
Electrical conductivity and ionisation constants of organic compounds. Scudder 1078
Elektroeisens; Geschichte des ——. Meyer 714
Explosions in coal mines; Notes on the prevention of dust and gas ——. Rice 378
Explosives in coal mining; Use and misuse of ——. Rutledge 378
Explosives; Lectures on ——. Macnab 670
Explosives: Report of Departmental Committee on the heat test as applied to —— 444
Explosives; Report of His Majesty's Inspectors of —— for 1913 1078
Explosives; Tests of permissible ——. Hall and Howell 378
Factories and Workshops; Report of Chief Inspector for 1913 898
Farbenchemie; Lehrbuch der —— einschliesslich der Gewinnung und Verarbeitung des Teers. Bucherer 616
Fermentation; Alcoholic ——. Harden 670
Fibre vegetale, lane, peli, pelliccie, sete naturali, sete artificiali; Studio microscopico delle ——. Analisi quantitativa dei tessuti. Solaro 46
Filters and filter-presses. Theory of filtration, and filtration in sugar factories and refineries. Bühler and Eastick 810
Fuel-briquetting investigations, July, 1904, to July, 1912. Wright 572
Fuels used in Texas; The ——. Phillips and Worrell 572
Gas analysis; Technical ——. Lunge 1174
Gas chemists' summary, 1913; The ——. Hendrickson 670
Gas industry; Catalysis in the ——. Lessing 1077
Gas; Production of natural —— in 1913. Hill 1230
Gas; Purification of —— by heat. Carpenter 1078
Gerbstoffe; Die ——. Botanisch-chemische Monographie der Tannide. Dekker 46
Glass blowing; Laboratory manual of ——. Frary 379
Glue and glue testing. Rideal 1077
Imperial Institute; Bulletin of the ——. Vol. XII. No. 3. 1078
India-rubber laboratory practice. Caspari 379

PAGE
Inorganic chemistry; Text-book of ——. Friend and others 1175
Institute of Chemistry of Great Britain and Ireland; History of the —— (1877—1914) 898
Institution of Petroleum Technologists; Journal of the ——. Vol. I. Part I. 770
Intermetallic compounds. Desch 379
Iron-bearing district, New Brunswick; Austin Brook ——. Lindeman 378
Iron-bearing district, Ontario; Moose Mountain ——. Lindeman 1175
Karbide und Silizide. Hönigschmid 379
Kohlenhydrate; Kurzes Handbuch der ——. Tollens 379
Konstitution und Konfiguration von Verbindungen höherer Ordnung. Werner 280
Lilly Scientific Bulletin. Series I. No. 4 106
Lime; The source, manufacture and use ——. Burchard and Emley 1230
Magnetite occurrences near Calabogie, Renfrew County, Ontario. Lindeman 1175
Magnetite occurrences along the Central Ontario Railway. Lindeman 378
Medikamentösen Seifen; Die ——. Schrauth 378
Merck's Annual Report of recent advances in pharmaceutical chemistry and therapeutics 505
Metals; Synthetic use of —— in organic chemistry. Hale 444
Mines Branch of Dept. of Mines, Canada; Summary report of —— for 1912 378
Mines and quarries. General report with statistics:
  1911. Part IV. Colonial and foreign statistics 106
  1912. Part II. Labour 46
  1912. Part III. Output 106
  1913. Part I. Divisional statistics 810
Nitrocellulosen; Die ——. Haeussermann 810
Nitrogen; The fixation of atmospheric ——. Knox 670
Nucleic acids. Their chemical properties and physiological conduct. Jones 572
Nutrition. A guide to food and dieting. Sohn 1078
Oils, fats, and waxes; Chemical technology and analysis of ——. Lewkowitsch:
  Vol. I. 106
  Vol. II. 1038
Oil-seeds, oils, fats, and waxes. Selected reports from the Scientific and Technical Dept., Imperial Institute 379
Organic chemistry; A laboratory manual of —— for beginners. Holleman. (Edited by Walker) 378
Organic chemistry; A text-book of ——. Holleman. (Edited by Walker) 378
Organic chemistry; A third year course of ——. Hilditch 379
Patent law and practice; The inventor's handbook of ——. Bradley and Bowman 946
Patents, Designs and Trade Marks. Report of Comptroller-General for 1913 444
Peroxyde und Persalze; Anorganische ——. Von Girsewald 572
Petroleum; Production of —— in 1913. Day 1230
Petroleum resources of Bondoc Peninsula, Philippine Islands; Geology and ——. Pratt and Smith 444
Pharmacology, clinical and experimental. Meyer and Gottlieb (translated by Halsey) 572
Pharmacy; Year Book of ——. Braithwaite, Bennett, and Gamble 46
Philippine Islands; Industrial resources of the —— 810
Photomicrography; Handbook of ——. Hind and Randles 165
Physical chemistry; Practical ——. Gray 898
Poisons and habit-forming drugs. Wilbert and Motter 378
Saccharomyces apiculatus; Recherches sur 17 formes du ——. Klöcker 106
Saponi; L'Industria dei ——. Scansetti 988
Saponi da Toeletta. Franchi 1077
Schutzkolloide; Studien über ——. Kolloides Silber. Kolloides Gold. Gutbier and Weingärtner 46
Science and the miller. Remington 946
Silk-worms; Instructions for rearing mulberry ——. De. 670
Smoke problem; Some engineering phases of Pittsburgh's —— 846

PAGE
Steel analysis; Modern —— Pickard 414
Subject lists of works in Patent Office Library:
  Enamelling, art metal work, furniture, costume, etc. 946
  Fine and graphic arts 811
  General physics 946
  Photomechanical printing and photography 811
  Silicate industries (ceramics and glass) 811
  Sound and light 946
Sugar factory; Evaporation in the cane and beet —— Koppeschaar 224
Symboles Internationaux. Commission Electrotechnique International 378

PAGE
Technischen Chemie: Enzyklopädie der ——. Vol. I. Ullmann 714
Trade of United Kingdom with foreign countries and British possessions; Annual statement of the —— for 1913 946
Van Nostrand's chemical annual, 1913. Olsen and Melhado 1078
Viscosity of liquids; The ——. Dunstan and Thole 444
Wasseruntersuchung: Praktikum der chemischen, biologischen und bakteriologischen ——. Emmerling .. 572
Water, sewage, foods and other substances: Chemical examination of ——. Purvis and Hodgson 1077
Who's who in science (international), 1914. Stephenson ... 46

LIST OF JOURNALS ABSTRACTED, WITH ABBREVIATIONS USED, AND ADDRESSES OF PUBLISHERS AND PRICES.

Journal.	Abbreviation.	Address of Publisher, and Price.*
Agricultural Ledger	Agric. Ledger	Reporter on Economic Products to the Government of India, Calcutta.
Allgemeine Zeitschrift für Bierbrauerei und Malzfabrikation	Allgem. Z. Bierbrau. u. Malzfabr.	Michaelerstrasse 25, Vienna XVIII/$_1$. Krone 12 per annum.
American Journal of Pharmacy	Amer. J. Pharm.	145, North Tenth Street, Philadelphia, Pa., U.S.A. 30 cents.
American Journal of Science	Amer. J. Sci.	New Haven, Conn., U.S.A. $6.40 per annum.
Analyst	Analyst	Simpkin, Marshall, Hamilton, Kent, and Co., Ltd., 2, 4, 6, 8, Orange Street, London, S.W. 2s.
Annalen der Chemie	Annalen	C. F. Winter'sche Verlagshandlung, Leipzig, Germany. M. 24 per annum.
Annales de Chimie Analytique	Ann. Chim. Analyt.	M. Crinon, 45, Rue Turenne, Paris, 3e. 1 fr.
Annales des Falsifications	Ann. Falsific.	56, Rue Madame, Paris, 6e. 2 fr.
Annali di Chimica Applicata	Annali Chim. Appl.	Via Panisperna N, 89*b*, Rome. Lire 34 per annum.
Annali della R. Stazione Chimico Agraria Sperimentale di Roma	Ann. R. Staz. Chim. Agrar. Sperim. Roma	R. Stazione Chimico-Agraria Sperimentale di Roma, Rome.
Apotheker-Zeitung	Apoth.-Zeit.	Levetzowstrasse 16b, Berlin, N.W. 87. 25 Pf.
Archiv der Pharmazie	Arch. Pharm.	Selbstverlag des Deutschen Apotheker-Vereins, Berlin, Germany. M. 12 per annum.
Atti della Reale Accademia dei Lincei, Roma	Atti R. Accad. dei Lincei, Roma	Tipografia della R. Accademia dei Lincei, Rome. Lire 10 per annum.
Berichte der Deutschen Chemischen Gesellschaft	Ber.	R. Friedländer und Sohn, Karlstrasse 11, Berlin, N.W. 6, Germany. M. 32 per annum.
Berichte der Deutschen Pharmazeutischen Gesellschaft	Ber. deuts. Pharm. Ges.	Verlag von Gebr. Bornträger, Berlin, W. 35, Schöneberger Ufer 12A, Germany. M. 20 per annum.
Biedermann's Zentralblatt für Agricultur Chemie	Biedermann's Zentr.	O. Leiner, Königstrasse 26B, Leipzig, Germany. M. 22 per annum.
Bio-chemical Journal	Bio-chem. J.	Cambridge University Press, Fetter Lane, London, E.C. 7s.
Biochemische Zeitschrift	Biochem. Zeits.	Verlag von J. Springer, Berlin, W. 9, Linkstrasse 23/24. M. 14 per volume.
Board of Trade Journal	Bd. of Trade J.	Messrs. Wyman and Sons, Fetter Lane, London, E.C. 3d.
Brewers' Journal	Brewers' J.	F. W. Lyon, Eastcheap Buildings, Eastcheap, London, E.C. 2s.
British and Colonial Druggist	Brit. and Col. Drug.	104-200, Bishopsgate, London, E.C. 5s. per annum.
Bulletin de l'Association Chimique de Sucre et de Distillerie	Bull. Assoc. Chim. Sucr.	156, Boulevard Magenta, Paris, 10e, France. 2 fr.
Bulletin of the Bureau of Agricultural Intelligence and of Plant Diseases	Bull. Bureau Agric. Intell.	International Institute of Agriculture, Rome. 2 fr.
Bulletin of the Bureau of Standards (U.S.A.)	Bull. Bureau of Standards (U.S.A.)	Government Printing Office, Washington, D.C. 25 cents.
Bulletin de la Société Chimique de Belgique	Bull. Soc. Chim. Belg.	M. J. Wauters, Palais du Midi (Galerie du Travail, 7), Brussels.
Bulletin de la Société Chimique de France	Bull. Soc. Chim.	Masson et Cie., 120, Boulevard Saint-Germain (6e), Paris. 38 fr. per annum.
Bulletin de la Société Française de Photographie	Bull. Soc. Franç. Phot.	51, Rue de Clichy, Paris, 9e. 1 fr. 50.
Bulletin de la Société Industrielle du Nord de la France	Bull. Soc. Ind. Nord	Rue de l'Hôpital Militaire 116, Lille, France.
Bulletin de la Société Industrielle de Mulhouse	Bull. Soc. Ind. Mulhouse	Berger-Levrault et Cie., 5, Rue des Beaux-Arts, Paris. 60 fr. per annum.
Bulletin de la Société d'Encouragement pour l'Industrie Nationale	Bull. Soc. d'Encour.	Secrétariat, Rue de Rennes 44, Paris, France. 36 fr. per annum.
Le Caoutchouc et le Gutta-Percha	Caoutchouc et Gutta-Percha	A. D. Cillard fils, 49, Rue des Vinaigriers, Paris, X. 26 fr. per annum.
Chamber of Commerce Journal	Ch. of Comm. J.	Oxford Court, Cannon Street, London, E.C. 1s.
Chemical News	Chem. News	E. J. Davey, 16, Newcastle Street, Farringdon Street, London, E.C. 4d.
Chemical Trade Journal	Chem. Trade J.	Davis Bros., Danes Inn House, 265, Strand, London, W.C. 4d.
Chemical World	Chem. World	J. and A. Churchill, 7, Great Marlborough Street, London, W. 6d.
Chemiker-Zeitung	Chem.-Zeit.	Dr. v. Vietinghoff-Scheel, Cöthen, Anhalt, Germany. M. 28 per annum.
Chemische Industrie	Chem. Ind.	Weidmann'sche Buchhandlung, Zimmerstrasse 94, Berlin, S.W., Germany. M. 20 per annum.

---

* The price for single copies is given where these are sold separately. In other cases, it is only possible to buy the Journals in question in complete volumes.

JOURNAL.	ABBREVIATION.	ADDRESS OF PUBLISHER AND PRICE.
Chemische Revue über die Fett- und Harz-Industrie	Chem. Rev. Fett-Ind.	Dr. L. Allen, Catherinenstrasse 25, Hamburg, Germany. M. 1.75.
Chemisches Zentralblatt	Chem. Zentr.	R. Friedländer und Sohn. Karlstrasse 11, Berlin, N.W. 6, Germany. M. 80 per annum.
Chemist and Druggist	Chem. and Drug.	42, Cannon Street, London, E.C. 6d.

LIST OF ERRATA, 1914.

No. of Journal.	Page.	Column.	Line from Top.	Line from Bottom.	Errata.
No. 1—Jan. 15	32	1	..	14	*For* " Offerdahl-Larvik " *read* " Offerdahl."
No. 2—Jan. 31	73	2	..	16	*For* " 260,915 " *read* " 460,915."
,, ,,	93	2	25	..	*For* " Kempler " *read* " Kempter."
No. 3—Feb. 16	127	1	5	..	*For* " Cozzolins " *read* " Cozzolino."
,, ,,	136	2	..	9	*For* " 263,390 " *read* " 268,390."
No. 5—Mar. 16	254	1	..	22 & 23	These two lines should be transposed.
No. 6—Mar. 31	317	Table right-hand	8	..	*After* " 5 per cent." *insert semi-colon and after* " above " *a comma.*
,, ,,	323	1	27	..	*For* " lard " *read* " butter."
No. 10—May 30	557	2	..	9 to 12	*Delete these four lines and insert* " R. B. Earle, Assignor to Hood Rubber Co., Boston. U.S. Pat. 1,093,923, April 21, 1914."
No. 11—June 15	576	2	..	7	*For* " 1 in." *read* " 1 foot."
,, ,,	577	2	..	19	*For* " jelly " *read* " colloid."
,, ,,	578	1	12	..	*In analyses of pine oils table, col. 2, sp. gr. in last line should be* " 0·9383."
,, ,,	593	2	19	..	*For* " 1941 " *read* " 1914."
,, ,,	604	1	..	12	*For* " W. E. Heyl " *read* " G. E. Heyl."
,, ,,	608	2	12 & 13	..	*Should read* " Eng. Pats. 9170, Apr. 18, 1913, and 7456 of 1914, date of appl., Apr. 18, 1913."
No. 14—July 31	759	1	..	20 & 39	*For* " Anhydrat " *read* " Anhydat."
No. 15—Aug. 15	798	2	Title of Second Patent		*For* " Krapp " *read* " Krapf."
No. 17—Sept. 15	875	1	..	7	*For* " Van Fischenko " *read* " Von Tischenko."
No. 18—Sept. 30	917	1	4	..	*For* " Callebant " *read* " Callebaut."
,, ,,	933	2	8	..	*Insert patentee's name* " G. W. Sinclair."
No. 20—Oct. 31	1024	2	5	..	*For* " I. David " *read* " T. David."
No. 21—Nov. 16	1070	1	..	29	*For* " P. T. Muller " *read* " P. T. Müller."
No. 22—Nov. 30	1099	1	Title of First Patent		*Insert patentee's name,* " J. Haworth."
,, ,,	1110	1	..	23	*For* " capable " *read* " incapable."

Vacher & Sons, Ltd., Great Smith Street, Westminster, S.W.

Journal of the Society of Chemical Industry.

No. 1, Vol. XXXIII. JANUARY 15, 1914. No. 1, Vol. XXXIII.

The Society of Chemical Industry.

Past Presidents.

Rt. Hon. Sir Henry Roscoe, LL.D., F.R.S.	1881—1882.
†Sir Frederick A. Abel, Bart., F.R.S.	1882—1883.
†Walter Weldon, F.R.S.	1883—1884.
†Sir Wm. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt, LL.D.	1885—1886.
David Howard	1886—1887.
Sir James Dewar, M.A., LL.D. F.R.S.	1887—1888.
†Ludwig Mond, Ph.D., F.R.S.	1888—1889.
†Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
†E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., D.Sc., F.R.S.	1891—1892.

LIST OF COUNCIL, 1913-1914.

President : Dr. Rudolph Messel, F.R.S.

Vice-Presidents :

Julian L. Baker.
Sir Hugh Bell, Bart.
Prof. Marston T. Bogert.
Dr. Charles C. Carpenter.
Prof. W. Hodgson Ellis.
Sir Richard Garton.
H. Hemingway.
Prof. G. G. Henderson.
E. Grant Hooper.
Prof. W. J. Pope, F.R.S.
Walter F. Reid.
Maximilian Toch.

Ordinary Members of Council :

W. J. A. Butterfield.
Eustace Carey.
R. H. Clayton.
Prof. F. G. Donnan, F.R.S.
Dr. M. O. Forster, F.R.S.
D. Lloyd Howard.
Dr. Charles A. Keane.
W. J. Leonard.
G. W. MacDonald.
N. H. Martin.
Dr. W. Lash Miller.
J. Miln Thomson.

MR. H. T. PINNOCK IN THE CHAIR.

THE UTILISATION OF THE PHENOMENA OF PUTREFACTION, WITH SPECIAL REFERENCE TO THE TREATMENT AND DISPOSAL OF SEWAGE SLUDGE.

BY F. R. O'SHAUGHNESSY, A.R.C.SC., F.I.C.

The water carriage of solid refuse from domestic and industrial sources, whilst solving in a neat manner many of the problems of cleanliness, sanitation and commerce, has raised in the sewage itself a problem which is an exceedingly difficult one. It frequently happens that the difficulty of solving the sewage problem completely, grows at a greater rate than the volume of the sewage to be dealt with; for all along the line at each stage of clarification or purification of the sewage one is met by some difficulty, some hindrance, due to solid matter, which hampers the elimination of the soluble impurities in the liquor. So much is this the case that one may truly say that the sludge problem is the sewage problem, and certain of the difficulties, while easily coped with on a small scale, tend to get unmanageable on the large scale.

One of the most cogent difficulties too where masses of human ordure are accumulated is the prevention of aerial nuisance, and so important is this question in populous districts that the whole process is frequently modified and great expense incurred simply to achieve this end.

The fate of the sewage liquor and the conditions covering its treatment must greatly modify the process of sludge treatment, and I propose to show in a concrete case how such considerations have acted and are acting.

In 1908 the Royal Commission on Sewage Disposal in its Fifth Report dealt fairly fully with the sludge question at that time. Since then much work has been done both in this country and abroad towards the elucidation of this problem. The methods emerging and apparently finding increasing favour are towards the exhaustive digestion of the sludge by biological means. Incidentally some 20 to 30 per cent. or more of the solids of the sludge may be destroyed by the digestive process, but by far the most important result is the production of an odourless solid, which will dry in a reasonable time, all the operations being carried on without nuisance.

That such a digestive process may be conducted without nauseous smell is generally put down to the presence of iron in the sewage, but the fact is overlooked that the same result may be attained in a sewage with very little iron present; and on the other hand a sewage rich in iron may easily give rise to abominable odours during its treatment. In fact, whether iron is present or not, the greatest care must be exercised if nuisance is to be avoided, and if the digestive process is carried on under proper conditions the smell is generally least where the action is most vigorous. The advantage in the author's experience deriving from the presence of iron is that putrefactive change is held up in the sewage (as by any antiseptic trade waste). One has then a liquor relatively free from smell to manipulate, and although the iron undoubtedly causes difficulty in setting up active putrefaction later, still by proper manipulation this action can be promoted vigorously enough at the desired time, and then with a minimum of smell.

By sludge, the author indicates the solids deposited from sewage after the grit is removed. There are four ways in which sludge may be disposed of, viz. :—

(1) By burial in the ground.
(2) By discharge at sea.
(3) By burning.
(4) By tipping in hollows on waste ground.

True disposal consists in the destruction of the sludge *qua* sludge. Methods (1), (2) and (3) are absolute methods of disposal, whilst (4), although often having much to recommend it if the sludge has been properly prepared, cannot be carried on indefinitely, but has the advantage of cheapness.

The author proposes here to give a concise history of the evolution of the present process for treating the sludge at Birmingham. A natural process of elimination has operated whilst working towards the present system.

On March 10th, 1902, the author read a Paper before the London Section of this Society (this Journal, May 31st, 1902), in which some account was given of sludge treatment up to that time at Birmingham. The method up to 1900 consisted in chemical precipitation by lime (about

12 grains per gallon). The sludge was run on to the land in a crude state and allowed to dry, when it was dug in and a crop planted. The nuisance attaching to this method was intolerable, and in the early part of 1900, Mr. John D. Watson, the Engineer to the Drainage Board, introduced a method of trenching the sludge whereby the exposure to the air and therefore the nuisance was considerably reduced. Nevertheless the nuisance at times was very great, and another method was looked for. Lime treatment was given up and septic treatment introduced in 1901, and continued with various modifications, till the middle of 1911. At this time septic treatment of the whole sewage was adopted by general consent amongst many leading experts, and many varying statements were put forward as to the time the sewage should be submitted to the anaerobic digestion and as to the effects produced thereby. Witness for instance the conflicting evidence given by various experts before the Royal Commission on Sewage Disposal. The figure given for destruction of sludge by the septic tank at that time was :—

At Leeds	30 per cent.
At Manchester	25 per cent.
At Birmingham	10 per cent.

It soon became apparent that the septic tank as a means of sludge disposal had limitations, and with the steady growth of oxidising filters serious drawbacks appeared, viz. : (1) The very large "suspended solids" present in the septic tank effluent. (2) The nuisance produced by the septic tank effluent whilst being applied to the bacteria beds.

Unless a septic tank be of inordinate size in proportion to the flow the amount of suspended matter issuing from it in the tank effluent increases as the activity of the tank increases. The following figures are instructive in this regard :—

Sewage precipitated with 17 parts lime per 100,000 :—

	Suspended solids parts per 100,000.
Primary sedimentation tank	16·3
Secondary ditto	4·2

Sewage not limed but above tanks converted to septic tanks.

	Suspended solids parts per 100,000.
Primary sedimentation tank	30
Secondary ditto	26

The capacity of the primary tanks was later increased nearly 70 per cent., and that of the secondary tanks 44 per cent., and septic action was promoted freely in both sets of tanks. Notwithstanding the increased volume of the tanks, the effluents during the following years were as follows :—

Primary Sedimentation Tanks effluent.

	Suspended solids parts per 100,000.
During 1907	28·0
1908	29·9
1909	30·1
1910	31·1
First half 1911	25·7

Secondary Sedimentation Tanks effluent.

	Suspended solids parts per 100,000.
During 1907	24·2
1908	31·9
1909	19·1
1910	10·7
First half 1911	17·9

At this time the area of bacteria beds was being rapidly increased, and the disadvantage of the above septic tank effluent became more and more apparent. Further sedimentation in Dortmund tanks was given the tank liquor before passing it to the bacteria beds, but as this form of tank lends itself readily to septic action, the already foul liquor was rendered fouler and the sedimentation of the solids interfered with. Moreover two-thirds of the crude sludge arrested at Saltley outfall had to be treated by separate digestion in lagoons of huge size. The behaviour of the sludge in these lagoons furnished much extremely useful information, for it was seen that when once actively "working" crude sludge could be assimilated by them without any nuisance being produced. Their capacity, although great, was limited, and after 18 months they silted up (in 1909). The depth of the sludge in them after all the water had been drawn off the surface was about 10 feet. This sludge behaved like an emulsion and the water present was as follows :—

	Per cent. water.
At bottom 10 feet below surface	57·6
6 ditto	65·5
2 ditto	70·0
At the sufrace	75·0

It was found that on exposing the sludge from the above lagoon in layers about 12 inches thick on prepared plots of ground that after a time a hard dry sludge cake resulted.

For the reasons above mentioned and acting on the experience gained in these lagoons, experiments were started at Saltley in 1910 on the digestion of the crude sludge apart from the sewage liquor. The experiments continued till April, 1911, and indicated that vigorous putrefaction of the sludge apart from the sewage liquor could be expeditiously promoted, that no nuisance would be produced, whilst 15 to 20 per cent. of the sludge could be destroyed thereby. The resulting sludge was dried on prepared beds.

Curiously enough, following immediately on all this came the excessively hot summer of 1911, and the aerial nuisance produced by the exposure of the putrid tank effluent—about 25,000,000 gallons per day—during treatment, was so great and so extensive that it became absolutely necessary to change the process. The great sewer and Dortmund tanks were sterilised by bleaching powder, the putrid sludge from the primary sedimentation tanks was pumped away, and putrefaction of the sewage liquid was *prevented* as far as possible, whilst digestion of the sludge was started and *promoted* as much as possible. The nuisance abated immediately. This process has been steadily improved and extended since that time.

The primary sedimentation tanks (called Roughing Tanks by Mr. Charles Hawksley), five in number, have a combined holding capacity of 5,610,150 gallons. The sewage requires four or five hours to pass through them at ordinary times and deposits most of its suspended solids therein.

Analyses of Roughing Tanks effluent.

	Suspended solids.					Oxygen absorbed.	
	Total.	Volatile.	Free Amm.	Alb. Amm.	Cl.	Unsettled.	Settled.
1911*	25·7	13·7	4·12	1·06	16·5	21·74	15·66

1912	12·7	7·2	3·73	·85	13·5	14·87	10·21
1913	8·7	4·6	3·53	·72	14·2	15·07	11·90

* 1st six months. † 2nd six months.

Each "roughing" tank runs for from two to three weeks, when it is stopped, the water overlying the sludge pumped back to the sewer outfall, and the sludge containing on the average 86·6 per cent. water is pumped to the secondary sedimentation tanks now used as digestion tanks. These digestion tanks are 20 in number arranged as follows :—

			galls.
16 small tanks each of	283,700 galls. capacity	Total	4,539,500
4 large ditto	680,920 ditto		2,723,680
		Digestion tanks capacity	7,263,180

The primary sedimentation tank effluent passes for further sedimentation through a large balancing tank holding about 6,000,000 gallons of sewage and used to regulate the flow of sewage led to the bacteria beds.

The sludge.—The sludge consists of the bulk of the solids in the sewage less the detritus, the larger solids arrested by a 6 in. screen, and the fine light matter passing over the tank weirs above. In considering its qualities an analysis of faecal matter is given here for comparison :—

Results of analysis of faecal matter.

Water	80 per cent.
Dry solids	20 per cent.

The dry faecal matter contains :—

Matter volatile at red heat	85·70 per cent.
Matter non-volatile ditto	14·30 per cent.
Total nitrogen	5·31 per cent.

Absorbs 16 per cent. of its weight of oxygen
(*a*) From acid $KMnO_4$ at 80° F. in 4 hours
(*b*) Dissolved oxygen from water in 2 days at 65° F.

By prolonged agitation with water about 70 per cent. of the solid faecal matter will be taken up by the water mostly (about 60 per cent.) in colloidal solution. When once taken up in this way the colloidal matter separates again only with extreme slowness from the water. In passing it may be remarked that this furnishes a strong objection to the use of fine-mesh screens for the sewage, as they break up the incoming faecal matter and cause it to be taken up by the liquid. For the same reason there is a similar objection to the pumping of crude sewage.

The average results of analysis of the crude sludge as produced under present conditions of manipulation are as follows :—

	Per cent.
Water	86·6
Dry solid matter	13·4

The dry solid matter contains :—

	Per cent.
Matter volatile at red heat	58·5
Matter non-volatile ditto	41·5
Total nitrogen	2·71
Matter extracted by ether	22·20
Fatty matter extracted by ether	20·00
Resinous ditto	2·20
The saponification equivalent of the fatty matter	267·3
Ditto ditto resinous matter	111·2
Average specific gravity of wet sludge (60° F.)	1·047
Ditto ditto dry solid matter	1·50

The crude sludge is a foul smelling, viscous mass, dirty grey to brown or black in colour and highly colloidal.

The sewage liquor which has carried the above sludge to the outfall receives large consignments of trade effluents inimical to bacterial life. For instance the following results show this :—

	Approx. dry weather flow.	Aerobic organisms per c.c.	Anaerobic organisms per c.c.
	galls.		
Saltley crude sewage	1,750,000	873,000	152,000
Rea crude sewage ..	11,000,000	370,000	150,000
Hockley crude sewage	7,000,000	121,000	1,000
Aston crude sewage..	5,250,000	453,000	81,500

The above figures, too, probably represent merely the organisms which have survived the action of the poisonous bodies present in the liquor which wrought the destruction of their fellows, for an average sewage will contain from 3,000,000 to 9,000,000 or more organisms per c.c.

In this respect the following results obtained from a sludge which had proved refractory and had lain in the digestion tanks for about three weeks smelling offensively prove very interesting :—

		Total Counts Organisms per c.c.
Gelatin-Peptone-Bouillon at 20° C.	Mean	24,000
Agar-Peptone-Bouillon at 37° C.	Mean	130,000,000
Coli group		7,000
Proteus group (including Enteritidis Sporogenes)		100,000
Denitrifiers		500
Fat splitting organisms		10,000
Cellulose		100,000

Note.—See also d and d_2, page 6.

Not till this sludge had undergone prolonged digestion and been admixed with more active sludge did it lose its nauseous smell, notwithstanding great care in its manipulation.

Samples of the crude sludge may be isolated and kept for months under favourable conditions for its putrefaction, and yet will undergo only trifling loss of weight.

Method of calculating the loss of weight of the digested sludge.—It may be as well at this point to indicate the method by which the loss in weight of the digested sludge is calculated.

Let x = the percentage of water in the original undigested sludge.
y = ditto volatile matter in this sludge dried at 105° C.—110° C.
x_1 = ditto water in the sludge after digestion.
y_1 = ditto volatile matter in the digested sludge dried at 105° C.—110° C.
L = ditto loss in weight due to digestion of the original dried sludge.

Then $$\frac{y-L}{100-L} \times 100 = y_1.$$

and $$100y - 100L = 100y - Ly_1$$

From this we get $$L = \frac{100\,(y-y_1)}{100-y_1}$$

also $$x_1 = \frac{x \times 100}{100 - \frac{L\,(100-x)}{100}}$$

For instance a sludge containing 85 per cent. water, and 60 per cent. volatile matter in the dry solids, undergoes digestion, and the dry digested residue is found to contain 40 per cent. organic matter. Then the loss

$$L = \frac{100\,(60-40)}{100-40} = \frac{100 \times 20}{60} = 33\tfrac{1}{3} \text{ per cent.}$$

and the water content

$$x = \frac{85 \times 100}{100 - \frac{33\frac{1}{3}\,(100-85)}{100}} = \frac{85 \times 100}{100-5}$$

$$\frac{85 \times 100}{95}$$

$$= 89{\cdot}5 \text{ per cent. water.}$$

The rate of disappearance of the organic matter in the sludge, of its nauseous odour, and colloidal character varies greatly, depending largely on the conditions to which the sludge is subjected. For instance sludge buried in large masses in water-logged ground has been observed by the author to remain almost unaltered for years. The following table gives the fate of sludge under different conditions :—

Description.	Vol. matter in dry sludge.	Remarks.
	per cent.	
(a) Faecal matter + water standing 7½ years	81·1	Sludge still brown and emitting H_2S.
(b_1) Crude sewage sampled 9th May, 1913	60·4	
(b_2) Analysed (b_1) six months later	56·3	Represents 9·4 per cent. destroyed. Sludge slimy and smelling of indol.
(c_1) Crude sludge sampled 24th May, 1913	59·6	
(c_2) Analysed (c_1) six months later	54·4	Represents 11·4 per cent. destroyed. Sample still grey, slimy and foul.
(d_1) Crude sludge which "worked" badly and putrefied slowly for 3 weeks, giving off foul odours. Sampled May 20th, 1913.	54·7	Bacteriological analysis given above.
(d_2) Analysed (d_1) again six months later	52·9	Sample dark but still foul.
(e_1) Sludge digesting slowly but steadily, May 29th, 1913	52·6	Partially digested.
(e_2) Analysed (e_1) again six weeks later	51·8	Partially digested.
(e_3) Analysed (e_1) after standing six months	41·7	Nearly 28 per cent. of sludge destroyed
(f_1) Sludge which had undergone digestion with double pumping in tanks, Saltley. Sampled September 27th, 1912.	42·2	Time in tanks six weeks. Nearly 28 per cent. destroyed.
(f_2) Analysed (f_1) 13 months later	39·3	Represents 31 per cent. destroyed.
(g) Sludge which had digested about five years in bottom of deep lagoon.	41·0	Sludge about quite "worked out."
(h) Sludge which had been put through the existing process at Saltley and had digested seven or eight weeks.	48·7	Perhaps 20 per cent. of original sludge destroyed. Sample black and had lost its nauseous odour. (Bacteriological Analysis below).

The first set of experiments on the digestion of sludge apart from the sewage liquor were started in October, 1910, and included the passing of varying amounts of water through the digestion tanks for the purpose of washing away the products of digestion as they are formed. With a flow through the tanks of about 2,000 galls. per hour (1/600th of their volume) the effluent was as follows :—

The effluent water was black, foul and opaque containing much sediment and colloidal matter :—

	Parts per 100,000.
Suspended solids—	
Total	26·0
Volatile at red heat	14·0
Solid colloids (precipitated by Fowler's process and weighed)—	
Total	41·0
Volatile at red heat	33·5
Free and saline ammonia	8·76
Albuminoid ammonia	0·78
Chlorine	12·4
Oxygen absorbed in 4 hours at 80° F.—	
Unsettled liquor	20·34
Settled liquor	15·20
Soluble colloids	12·01
Soluble non-colloids	3·19
Organic introgen—	
In settled sample	5·32
In soluble colloids	2·52

There are serious objections in practice to the passage of water through the sludge in this manner. Experiments were made on similar lines in June and July of this year (1913) and numerous observations made both in the laboratory and on the large scale as to the effect of washing sludge in this way. The balance of evidence indicated that the washing assisted the digestion to some extent, but the advantage in practice was small as compared with the disadvantage entailed in the treatment of the very foul effluents and the dilution of the sludge by the washwater.

Numerous estimations were made of the ammonia present in the putrefying sludge (the NH_3 being taken as an index). Great variation was observed, but although the ammonia was as high in some cases as 130 parts per 100,000 the sludge "worked" quite vigorously notwithstanding.

The crude sludge to be dealt with at the Saltley works averages 4,860 cube yards per week, and contains on the average 86·6 per cent. water with an average density of 1·047 at 60° F. This means 3,833 tons of wet sludge per week, or 514 tons of dry matter of 1·50 specific gravity.

The whole of this huge mass of filth was treated by the process of destructive digestion about to be described, during 1912 and 1913, with on the whole good results. The Secondary Sedimentary Tanks referred to earlier, with a capacity of about 40,000 cube yards, were used for this purpose. It had often been observed that when a mass of sludge began to putrefy the action was slow at first, then very vigorous, and after a time the action slowed off. If now the putrid mass be vigorously shaken or disturbed (as by shaking a sample in the laboratory or by pumping on the large scale) the sludge will begin to "work" with renewed vigour, and the process is thereby much expedited. This fact was taken advantage of in practice.

The sludge digestion operations.—As the crude sludge was pumped over from the sedimentation tanks to the digestion tanks, a portion of the well rotted sludge was drawn from an adjoining tank by another pump and forced into the delivery main along with the crude sludge. In this way the relatively sterile crude sludge was inoculated. The best mixture was found to be 1 of ripe sludge to 4 of crude sludge. After a couple of days the mass of sludge began to "work" vigorously, and after a fortnight the action began to slow down. A portion was then withdrawn and pumped over into a second set of tanks when further vigorous working ensued. It was always necessary to leave a modicum of rotting sludge in each of the tanks when sludge was withdrawn, and the larger the bulk of this residue in proportion to the incoming fresh sludge the better.

It is estimated that this second pumping of the sludge lessens the time of maturing by five or six weeks, being equivalent to an extra tank capacity of 30,000 cube yards or more. Economically therefore the double pumping pays.

The results obtained in 1912 were as follows :—

	Water in sludge.	Volatile matter in dry sludge.	Original sludge destroyed.
	per cent.	per cent.	per cent.
Sludge pumped from Primary Digestion Tanks	89·3	45·3	23
Sludge pumped from Secondary Digestion Tanks	87·8	42·4	27
The corresponding	figures for	1913 are	:—
Primary Digestion tanks	—	50·0	16
Secondary Digestion Tanks	85·0	46·9	21

Fat in digested sludge 14·00%. Total nitrogen 2·47%.

Note.—Much water was pumped back to the sewer from the rotting sludge.

The resulting sludge from the above process is pumped on to specially prepared drying plots. An area of close on 50 acres has been laid out for this purpose. The plots are levelled and are about ¾ of an acre in size, and an earthen bank 2 ft. high is erected round the plot. Drains consisting of 4 in. agricultural drain pipes are laid a few inches in the ground at 9 feet apart and covered with ashes

The whole floor of the bed is then covered with ashes to a depth of 3 to 6 in., and the bed is ready for use.

The plot is filled with sludge to a depth of 18 in., and the sludge is then allowed to dry. Something like 60 per cent. of the water escapes by the drains and is pumped back to the sewer. In moderate weather perhaps 30 per cent. disappears by evaporation, though this latter varies considerably. The time required for the drying process varies from three weeks to several months, depending on the condition of the sludge and on the weather. When dry the sludge is lifted into wagons and carried as a hard innocuous mass to the tip.

Attempts have been made to use the dried sludge as a fuel. The author has found it to burn fiercely when once started with a good draught, and a good clinker may be obtained. But as a means of steam raising the enormous ash (nearly 60 per cent. of the solids) tends to flux and adhere to the furnace bars, and this together with the moisture militates against its use for this purpose. Two estimations have been made of the calorific value as follows :—

	Calorific value of sludge dried at 212° F.	
Sample No. 1	4803 B.T.U.	H. Silvester, B.Sc.
" No. 2	4120 B.T.U.	W. B. Davidson, M.A., Ph.D.
Average	4507 B.T.U.	

One lb. of the dry material will evaporate about 5 lb. water theoretically, but when burnt in house refuse destructor on large scale it has been found that 1 lb. dry sludge as lifted from the Drying Beds will evaporate 1 lb. water.

Discussion of the merits of the above Digestion Process.—It is evident from the results given above that the destruction of organic matter in the sludge is at first very rapid. The rate of destruction also diminishes rapidly, and the limiting value seems to be reached when about 30 per cent. of the original sludge has disappeared. It is quite remarkable that Birmingham sludge which has undergone exhaustive digestion for very prolonged periods, even for several years, has still an organic content of about 40 per cent. This represents a destruction of about 30 per cent. of the original sludge. After a time then the change in the sludge becomes excessively slow. Here the limit can be reached in seven or eight weeks, but the resulting sludge is still colloidal in character and does not dry rapidly. The time required to produce a non-colloidal sludge is about three months, so that the last half of the time is occupied chiefly with a physical change in the sludge. When this change is complete the sludge separates from the sludge-liquor, which latter becomes translucent whilst the sludge loses its adhesive properties.

The bacteriological analysis of a sample of sludge which had undergone active digestion under the above process for seven to eight weeks gave the following results :—

	Total counts.	
	Aerobic.	Anærobic.
	per c.c.	per c.c.
G.P.B. at 20° C.	52,000,000	15,700,000
A.P.B. at 37° C.	5,000,000	3,000,000
Coli group	60,000	
Proteus group	100,000 at least	
Denitrifiers	100,000 at least	
Fat splitting organisms	100,000 at least	
Cellulose organisms	50,000	

Note.—About 20% of the original sludge had been destroyed.

The large Balancing Tank referred to in this Paper arrests a portion of the residual suspended solids and also a part of the solid matter in colloidal solution, held in the effluent from the Primary Sedimentation or Roughing Tanks. This matter so arrested slowly accumulates on the floor of this enormous basin, and the tank is cleaned out every two to three months. The sludge derived therefrom is a very uniform, finely divided, mobile, black mass, which is quite inoffensive, having a slight tar-like odour. On analysis the following results were obtained :

	Per cent.
Water	89·7
Solid matter (dried at 105° C.)	10·3

The dry solids contained :—

	Per cent
Matter volatile at red heat	55·4
Matter non-volatile ditto	44·6
Fatty matter, etc., extractable by ether	21·9

About 10,000 to 12,000 cube yards of the above sludge are produced per annum.

It was anticipated from the experience and considerations outlined earlier in the Paper, that this sludge would be biologically active. This was actually found to be the case, and the sludge was drawn upon to inoculate the crude sludge being fed to the Digestion Tanks. The digestive process received thereby a considerable impetus ; and the thick coat or scum which had accumulated on these tanks during months or even years of work was rapidly dissipated after inoculation in this way. Advantage is now taken of the qualities of this sludge, and it is incorporated with the crude sludge as a matter of routine when a charge is removed from the Balancing Tank.

The Cost of the Process. The figures for costs were taken over as lengthy a period as possible in order to get the aggregate and average cost in a reliable manner.

(1) Cost of Tankage, Digestion and Pumping to Drying Beds :—

	£	s.	d.
Wages	1,622	10	0
Coal	710	5	0
Stores and materials	90	9	0
Repairs, etc.	22	10	0
Water charges	75	5	0
Total	£2,420	19	0

Volume of sludge dealt with over this period 260,000 c. yds. Approximate cost per c. yd. of wet sludge, 2¼d.

(2) Cost of Drying Sludge, Lifting and carrying to Tip :—

	£	s.	d.
28,816 c. yds. of dry sludge	990	17	7
Cost per c. yd. of dry sludge			8·3
Ditto wet sludge			2·5

(3) Hence adding 1 and 2 together we get :—

Total cost per cube yd. of wet sludge, 86·6 % water 4·7 pence.
Total cost per ton of wet sludge, 86·6 % water .. 6·3 pence.

In comparing this cost with that of other processes, account must be taken of the percentage of water in the sludges treated. Especial care is paid to the method of manipulation of the Preliminary Sedimentation (Roughing) Tanks to ensure the reduction of the water in the crude sludge to a minimum. The result is a fresh sludge of exceptional density, containing on the average 86·6 per cent. water. Until recent years the figure for the water content of the fresh sludge was between 90 and 95 per cent., and if the present sludge were allowed to contain say 90 per cent. water, then the volume of the sludge to be dealt with would be increased by one-third. Under these conditions the aggregate cost would be appreciably increased, but the cost per cubic yard would appear rather less than the figure given above (see table below). Caution must be exercised, therefore, in making comparisons of this kind, and a fairer figure for comparison is the cost per million gallons treated or *per capita* of population.

	s.	d.
Cost of the above process per million gallons of sewage ..	9	6
Ditto *per capita* of population per annum		1¼

The dry weather sewage flow is close upon 30,000,000 gallons per day, and the population close upon 1,000,000 souls.

The figures for cost given by the Royal Commission on Sewage Disposal are as follows :—

	Per ton of wet sludge containing 90 % water. pence.
Sea disposal	4·1—6·9
Trenching in soil	4—7
Pressing (for large towns)	7·7—12·6
Pressing and burning	15
Sludge digestion at Birmingham, with drying and tipping	5d (approximate)

In connection with the very ingenious process of sludge digestion adopted in Essen, Germany, and which has been applied and perfected by Dr. K. Imhoff at various works in Essen, and other towns under the administration of the Emschergenossenschaft, the author wishes to remark that whereas the Imhoff Tank deals admirably with the sludge derived from normal flows up to three times the dry weather flow, it does not appear to lend itself to the treatment of sludge from storm water. In August last the author was very interested to see when on a visit to Dr. Imhoff at Essen that tanks were being constructed for the treatment of storm water sludge on similar lines to those worked out at Birmingham and described above.

This Paper is brought forward to furnish a record of work done in an attempt to solve this troublesome problem in a large inland town. Finality is far from reached yet in the disposal of the sludge, and much investigation is proceeding as to the possibilities of the sludge in various directions.

The author wishes to thank Mr. John D. Watson, M.Inst.C.E., Engineer to the Birmingham Drainage Board, for allowing this information to be brought forward, and Mr. Arthur Bryan, Chief Assistant Engineer, for much valuable help in preparing some of the statistics. Dr. Gilbert J. Fowler, of Manchester, has kindly helped by making some of the bacteriological examinations. The author also wishes to mention the work done by Mr. D. L. Black, Superintendent of Works, who has very ably carried out the operations connected with the tankage and digestion of the sludge, and has often helped with valuable practical suggestions.

Discussion.

Mr. G. F. Bartrip enquired if the dried sludge had any manurial value. He believed that similar dried sludge formed a component part of some fertilisers. Were the recent proposals for the liberation of the fatty acids of any real value?

Mr. H. Silvester said that when contact beds were first introduced it was stated that they were capable of dealing with the suspended matter in spite of the fact that much of this was inorganic, and this was soon found to be impossible. Destructive distillation of the pressed sludge was advocated before the Society some years ago, but the profit shown on that occasion could not be realised with ordinary sewage sludge.

The great value of the paper before them resulted from the large scale of the operations, and the length of time over which the observations had been made. The figures for suspended matter in the tank effluent were higher than what he had generally found in the effluent from the septic tank of a local sewage works. There was, however, an abnormal amount of trade waste in that sewage, and the comparative absence of colloidal matter possibly accounted for their more complete removal. He should be glad to know the author's explanation of the further digestion that resulted from pumping, and also if there was a considerable amount of fatty matter present in the finished sludge, and whether the quantity was worth attempting to recover.

As regards the utilisation of the sludge as a fuel, apart from its low calorific value, he should expect the very fusible clinker of which there was a considerable amount and which would prevent anything like complete combustion, to operate against it. Had the author any experience on this point?

Dr. W. B. Davidson said he was of opinion that the sludge, if it were dried—and did not contain more than from 5 per cent. to 10 per cent. of moisture—might be of some value in the manufacture of producer gas. It might be mixed with good coke because the nitrogen content was rather higher than ordinary coal. The question of ash was not a great objection with boilers of large capacity, as fuels with 30 per cent. of ash could be used. He would like to give the sludge a trial. If the cost of carriage were high, he doubted whether it would pay.

The Chairman (Mr. H. T. Pinnock) stated that he had tried the experiment of using dried sludge for making producer gas. It came from Bradford, and made an excellent ammonia recovery and rich gas, but difficulty was experienced owing to the large amount of ash, and the offensive smell resulting, when used in an open producer. He thought the sludge, however, might be used in a properly constructed producer.

Mr. Wm. Cliford said it was no small achievement to convert the whole of the sludge deposited at Saltley into a comparatively inodorous material and incidentally to reduce the bulk very considerably, even though the final dumping of the residue at a tip left something to be desired. The difficulties of dealing with large volumes of sludge in such a way as not to cause a nuisance raised the question of the advisability of draining the sewage of large inland populous areas to one outfall works. Destruction, whether by digestion or otherwise, was a last resort against nuisance and practically admitted failure to find a means for the utilisation of the sludge.

On the question of costs, one would like to know more fully what was included in the figures given, and how that amount was equivalent to 1½d. per capita. Did the amount include interest and sinking fund on all or any of the capital expenditure involved in the process of sludge disposal? Had any allowance been made for maintenance and repairs charges on tank and plant? Was any part of the establishment charges allocated to sludge disposal? The present process was the latest of a series which had their day and no doubt left a residue in the form of interest and sinking funds on scrapped plant and depreciated lands. Was anything taken of these charges? In short, where did the charges begin and where did they end?

Mr. O'Shaughnessy, replying, said that sewage sludge was a very slow acting manure and as against modern fertilisers was little favoured by farmers. The cost of transit even, deterred farmers from using it and the managers of small works were considered fortunate if they could get rid of their sewage sludge to farmers in their immediate neighbourhood. In certain exceptional instances it was possible to get a small fee of 6d. or 1s. per ton for the dried or pressed sludge. Innumerable attempts had been made to convert sewage sludge into a marketable manure, but notwithstanding repeated failures the problem was being actively investigated by various workers. The matter had received some attention from the Royal Commission on Sewage Disposal, and in their Fifth Report in 1905 they give the results of experiments and field trials by various experts on the manurial value of manures prepared with sewage sludge as a base. These results were not very encouraging.

Several investigators now claimed that they had evolved processes which were capable of yielding a handsome profit, and further experience of these would be awaited with interest.

With respect to the recovery of fatty acids from sludge, Dr. Grossmann, of Manchester, stated that he was doing this profitably at Oldham.

Mr. Silvester asked for the explanation of the increased activity resulting from the second pumping of the putrefying sludge. The bulk of the solid matter in the sludge fell after a time to the bottom of the tank, and the author's theory was that the products of putrefaction accumulated in the vicinity of the solids and tended to stop the action. Also digestion did not take place uniformly, and when the putrid sludge was pumped over into another tank, the whole mass was well mixed thereby and the organisms were again capable of acting vigorously.

It was true, as Mr. Silvester observed, that the fusibility of the clinker from the burning of sewage sludge, presented a serious difficulty in the way of the use of the sludge as a fuel. The fatty matter in the digested sludge was about 14 per cent. and the question of its use was under investigation.

The author was pleased to hear Dr. Davidson's optimistic opinion on the sludge as a source of producer gas, and Mr. Pinnock's results were in accord with that opinion.

The Birmingham Drainage Board Authorities would no doubt be pleased to let Dr. Davidson have some of the sludge for experimental purposes.

With respect to Mr. Clifford's observations he might say that whilst it was true that some of the valuable constituents of the sludge were destroyed by this process, the analysis of the final product showed that a little over one-third of the fatty matter and about one-fourth of the nitrogen were lost. The phosphoric acid would be very little altered. It was therefore far from the fact to say that the digested sludge resulting from the process was useless. In view of the possibilities of this sludge and the large amount of promising investigation going on just now he (the author) considered it a very desirable thing to accumulate the sludge on a tip. This process made such storage possible by eliminating the nauseous character of the sludge.

The merits of small versus large outfall works were chiefly engineering and financial ones, which usually told in favour of the large installation.

The means for utilising the sludge had yet to be worked out, and if the claims of the inventors of some recent processes were realised when tried on a large scale, then this means would be very shortly at hand. In the meantime the processes like the one described in this paper relieved the community of a serious nuisance.

The difficulty in connection with the manurial value of sludge was exemplified by the small proportion of the nitrogenous matter destroyed by the above process. This provided independent evidence of the extreme slowness with which the nitrogen became available for the nourishment of plant life.

As to the cost of the process, the costs given above were working costs, and included maintenance and repairs of working parts of machinery. From a mechanical point of view the process was simple and the wear and tear very small. The interest on capital and sinking fund charges were in this case very intricate, and so involved that it was almost impossible to assess them accurately. Their net contribution to the figure for cost was however probably small.

NOTE ON GRU-GRU OIL.

BY A. W. KNAPP, B.SC., F.I.C.

Gru-gru is the Trinidad name for *Acrocomia sclerocarpa.* I saw trees of the same species (*Acrocomia lasiospatha*) in Grenada, and they are said to grow in many parts of S. America. They will grow in the poorest of soils. The trunk has at intervals circles of sharp spines, so that it is almost impossible to climb. The tree belongs to the same tribe as the coconut palm—the leaflets are thinner and the trunk is generally swollen in the middle. The leaves are said to yield a very delicate fibre. The fruits are oblate spheroid in shape, about the size of a large plum, and dark green in colour. The skin is very tough, but if the fruits are allowed to fall to the ground this rots off leaving the nuts behind, the kernels remaining sweet. The shell of the nut is about ⅛-inch thick and hard, the kernel (⅝-inch across) has the appearance and flavour of coconut, but is tougher and more transparent.

Fruit: length 1½ inch, breadth 1¾ inch, weight 30 grammes.

	Per cent.
Pericarp	59·73
Shell	31·30
Kernel	8·97
	100·00

Dry ether extracts 2·44 per cent. from the pulp of the pericarp. The kernel contains:—

	Per cent.
Fat (petroleum ether extract)	49·13
Water	8·14
Albuminoids	13·70
Fibre and unestimated	29·03
	100·00

One tree I examined had on it 9 large bunches, each bunch containing about 400 fruits, that is, in all 3,600. The kernels were collected in March. The oil, which was obtained from the kernels by pressing them when hot, gave the following figures:—

	Oil.	Insoluble fatty acids.
Colour	Very pale yellow	White
Odour	Like coconut oil	Like coconut fatty acids
Taste	Ditto	Ditto
Sp. gr. (99° C. water at 15·5° C.)	0·861	0·838
Melting point	26·0° C.	24·0° C.
Titer		23·05° C.
Iodine value (Wijs)	19·4	20·3
Refraction at 40° C.	36·95	19·7
Saponification value	243·5	
Reichert-Meissl value	7·2	
Polenske value	13·9	
Shrewsbury and Knapp	163·0	
Neutralisation value	—	261·9
Mean molecular weight	—	214
Free fatty acids (as oleic)	0·62%	

From the above properties I conclude that this is the same oil as Mocaya oil of Paraguay and the oil from the maccasuba palm of Surinam (see De Nigri and Fabris, Chem. Rev., 1897, 82; and Sack "Inspectie van den Landbouw in West Indie," Bulletin 5, 1906).

It is evident both from the organoleptic and analytical tests that the oil is very similar to coconut and palm-kernel oils, so that it consists chiefly of laurin and myristin. It contains about 12 per cent. more olein than coconut oil, and hence should have about the same value as palm-kernel oil.

The soap produced from this oil is almost white and has excellent lathering properties, and the "stearine" from the oil would make a good edible fat.

It is not at present cultivated in the West Indies, and hence, although widely distributed is only thinly scattered, so that the gathering of sufficiently large quantities presents considerable difficulty. Further, the nuts are very hard. The shells when cracked are heavy enough to be separated from the kernels by immersion in brine. Last June, as an experiment, copra was prepared from gru-gru nuts in St. Vincent.

In conclusion I wish to thank Mr. S. B. Phillips for his assistance.

DISCUSSION.

Mr. **SILVESTER** asked if the author had any knowledge of gru-gru oil being used, for cocoanut oil, in the manufacture of margarine.

Mr. **KNAPP** replied that he was not aware that such a practice was followed, though there was no reason why it should not be pursued.

MR. T. W. LOVIBOND IN THE CHAIR.

THE SOLUBILITY OF MINERAL PHOSPHATES IN CITRIC ACID.

BY G. S. ROBERTSON, B.SC.

Quite recently artificial manure manufacturers have placed on the market large quantities of mineral rock phosphates as a suitable phosphatic manure. These mineral phosphates, in spite of the fact that they are very finely ground, are only slightly soluble in 2 per cent. citric acid.* They were therefore assumed to be of little use as an available manure compared with basic slag and bone meal, in which 80 to 95 per cent. of the phosphates are soluble in 2 per cent. citric acid.

With the object of testing mineral phosphates a series of experiments were laid down at Cockle Park, the results of which are given in the following tables :—

TABLE I.*

Upper Brick Field.

Plots 1/20th acre.	Three years' ley.	Average yield of hay for 3 years, per acre.
		cwt.
1.	10·85 cwt. of basic slag, 35·89 % phosphate of lime, 95% citric soluble	38¼
2.	9·1 cwt. basic slag, 42·7% phosphate of lime, 75% citric soluble	39¾
3.	9·75 cwt. basic slag, 39·97% phosphate of lime, 88·6 % citric soluble	39¾
5.	8·5 cwt. bone meal, 46·64% phosphate of lime, mostly citric soluble, and also contained 4·78% nitrogen	40¼
6.	6·6 cwt. Tunisian phosphate, 59·99% phosphate of lime, trace citric soluble .	37½
7.	No dressing	33¾
8.	10·5 cwt. Belgian rock phosphate (calcined) 37·16% phosphate of lime, trace citric soluble	40½

* See Guide to Cockle Park for 1913, page 39, also Guide for 1914.

TABLE II.*

Tower Hill Field.

Plots 1/20th acre.	Three years' ley.	Average yield of hay for 2 years per acre.
		cwt.
1.	9·5 cwt. basic slag, 41·3% phosphate of lime, 89% citric soluble	41¾
2.	19·7 cwt. basic slag, 19·82 % phosphate of lime, 66% citric soluble	44¾
3.	8·5 cwt. bone meal, 46·64% phosphate of lime, mostly citric soluble, also contained 4·78% nitrogen	38¾
4.	No dressing	38
5.	8·6 cwt. Tunisian rock phosphate (ground) 45·3% phosphate of lime, trace citric soluble............................	42½
6.	8·25 cwt. Belgian rock phosphate (ground) 47·2% phosphate of lime, trace citric soluble............................	42¾
7.	16·25 cwt. Belgian rock phosphate (calcined), 24% phosphate of lime, trace citric soluble	44½
8.	4·12 cwt. Belgian rock phosphate (ground) 47·2% phosphate of lime, and 6·5 cwt. superphosphate, 29·9% soluble phosphate of lime..................	45¾

* See Guide to Cockle Park for 1913, page 40. Also Guide for 1914

The cost of a unit of phosphate in rock phosphates is only about 9d., whilst in basic slag it is about 1s. 4d. It will therefore be readily understood that the use of rock phosphates might prove of considerable economical importance.

With the object of finding a satisfactory explanation of the successful results obtained by the use of rock phosphates, the following short investigation was carried out.

At the commencement of the investigation a Belgian rock phosphate and a calcined Belgian rock phosphate were submitted to two consecutive extractions with 2 per cent. citric acid. The Belgian phosphate showed three times as much phosphate soluble in the second extraction as in the first, while the calcined sample showed ten times as much soluble in the second as in the first extract.

These results led to five consecutive extractions being made of each of four rock phosphates. The results of these extractions are given in the following table :—

TABLE III.

Belgian Rock Phosphate.

Extraction.	P_2O_5	$Ca_3P_2O_8$	CaO

1st	1·22	2·65	19·96
2nd	4·90	10·68	9·05
3rd	4·26	9·28	6·48
4th	4·12	8·99	5·84
5th	3·15	6·90	4·42
Total for 5 extractions	17·65	38·50	45·75
Actual totals	24·29	53·01	55·79

In the case of the calcined Belgian phosphate it is probable that the large amount of free lime present did by neutralising the citric acid interfere with the solubility of the phosphates in the first extract. These results undoubtedly show that these rock phosphates are completely soluble in citric acid, if enough citric acid is used, and enough time is spent in the extraction. Further, if we take into consideration the fact that the process of solution in the soil rendering phosphates soluble is a continuous one, then the reasons why these so-called "citric insoluble phosphates" give just as good results as the high citric soluble slags is readily understood. It is worthy of note that the second and third extractions give the bulk of the phosphates soluble in citric acid, but the first extract contains more lime than any other extract. In other words, the citric acid test as commonly performed is a test for lime rather than a test for phosphates.

Conclusions.—This investigation demonstrates the worthlessness of the citric acid test as a means of judging the relative value to the plant of phosphatic manures. The original purpose of the citric acid test was to detect adulterations, against which purpose nothing is urged.

---

* To perform this test 5 grms. of the phosphate are placed in a litre flask containing 500 c.c. of 2% citric acid solution. The flask is shaken end over end for 30 minutes in an apparatus making 30 revolutions per minute.

It is the subsequent interpretations which have been put on this test that the author considers unreliable.

Summary of Field Experiments on Three Years' Ley.

Slag (200 lb. P_2O_5 per acre) ..	5	13	40·3
Bone meal (200 lb. P_2O_5 per acre)	2	5	39·7
Mineral phosphates (200 lb. P_2O_5 per acre)	5	12	41·0
No manure................	2	5	35·2

The author wishes to express his sincere thanks to Mr. S. Hoare Collins for his invaluable advice and suggestions, and to Professor Gilchrist for permission to publish the figures in Tables I. and II.

ON THE DIFFERENCE BETWEEN THE CALCULATED AND DETERMINED CALORIFIC VALUES OF COAL GAS.

BY G. WEYMAN, M.SC.

In the course of the examination of the gas manufactured at the Elswick and Redhough Works of the Newcastle and Gateshead Gas Company, some interesting points were observed. It was noticed that the difference between the calculated and actually determined calorific values was about 28 B.T.U. per cub. ft. for the gas manufactured in the horizontal retort plants, and this difference —provided no great change was made in the method of working—was remarkably constant. When the vertical retort plant was started at Elswick, it was evident that no less than about 43 B.T.U. would have to be added to the calculated value to bring it up to the determined. When, some months later, a tar circulation was introduced to keep the cross-collecting mains free from thick tar, the difference between the two values considerably decreased. The tar for the circulation, which at first was taken back to the wells as soon as it entered the large main, was subsequently allowed to run with the gas right along to the condensers. A further decrease in the difference between the two calorific values was noticed. Suspicions as to stripping of the gas by the tar were aroused, and the following experiments were made to solve the point.

1. A twenty cubic-foot holder was filled with gas from the vertical plant, mixed, and allowed to attain a constant temperature. The calorific value was determined and an analysis made. The gas was then passed through a a sample of the tar at 16° C., which had been taken from the tar outlet beside the works' condensers and again examined. From the results shown in Table No. 1 it is evident that the calorific value of the gas had been depreciated by 11·7 B.T.U. by passing through the tar. The tar has stripped the gas of some hydrocarbons. The calculated calorific value (the constants used are taken from the table in Coste's *Calorific Power of Gases*), however, is practically the same. One would imagine then that the hydrocarbons removed by the tar are such as are not estimated in the analysis. In fact the olefines show a slight increase; while the carbon monoxide has suffered to the extent of nearly 1 per cent. The methane and hydrogen also show a change which is more than warranted by experimental error.

TABLE 1.—*Gas and tar separated at 72°. C.*

	Without tar.	Tar at 16° C.
Cal. val. gross detd.	559·3	547·6
Cal. val. calc. gross	542·5	543·1
CO_2	0·0	0·0
O_2	0·8	0·8
CnHm	2·1	2·2
CO	8·6	7·8
CH_4	29·9	29·5
H_2	53·2	54·7
N_2	5·4	5·0
	100·0	100·0

Note.—In all the analyses which were made in the Sodeau Apparatus the CnHm were absorbed in bromine water, the CH_4 and H_2 determined by explosion, and the N_2 by difference. All the calorific values are in gross B.T.U. pr. c. ft.

A fresh series of experiments was made in which the tar was heated to different temperatures. It should be noted that the gas and tar were separated in the works at 72° C. and in the results given in Table 2, the calorific value at 75° C. is slightly higher than the original sample of gas, while below this temperature it gradually decreases in value.

TABLE 2.—*Tar and gas separated at 72° C.*

	Without tar.	Tar at 60° C.	Tar at 64° C.	Tar at 70° C.	Tar at 75° C.
Cal. val. detd. gross....	555·6	542·0	544·5	553·1	558·8

An additional series of experiments gave confirmatory results which are shown in Table 3 :—

TABLE 3.—*Tar and gas separated at 72° C.*

	Without tar.	Tar at 85° C.	Tar at 87° C.	Tar at 92° C.	Tar at 86° C.	Tar at 75° C.	Tar at 60° C.
Cal. val. detd. gross	543·6	549·6	551·1	554·7	555·2	548·0	535·5
Cal. val. calc. gross	545·7			544·4			
CO_2	0·0			0·0			
O_2	0·4			0·3			
CuHm	2·4			2·4			
CO	9·1			8·8			
CH_4	29·4			29·2			
H_2	53·1			53·6			
N_2	5·6			5·7			
	100·0			100·0			

In this series the tar was gradually heated and then slowly cooled, the calorific value and samples for analysis being taken at intervals. The calculated value for the original gas is higher than the determined, but falls below as the temperature at which it passes through the tar is raised above 70° C. Considering these results as a whole it is quite clear that there are present in the gas some hydro-carbon vapours, which are not estimated in the analysis and therefore, while they contribute towards the determined calorific value, are not included in the calculated figure. These hydrocarbon vapours, unlike the hydro-carbons estimated by bromine are easily removed by tar, in fact a state of equilibrium exists between tar, gas and hydro-carbon vapour, which depends on the temperature at which they are in contact. The higher the temperature, the greater will be the amount of vapour in the gas, and if the gas is then removed, it will of course carry the vapour with it. Also it is evidently these vapours which make the difference between the calculated and determined values, rather than any difference in composition of the olefines determined by absorption in bromine water. The variation in the difference between the calculated and determined values shown in connection with the vertical plant is clearly due to the lower temperature of separation of tar and gas when the tar circulation was introduced, with consequent reduction in the amount of hydro-carbon vapour present. These considerations led me to find a way of estimating these hydro-carbon vapours, and I soon found that Bunsen had distinguished between the permanent unsaturated gases, ethylene, propylene, etc. (the olefines) and the vapours of volatile saturated hydro-carbons. Bunsen found that the vapours could be dissolved out in absolute alcohol, while the excess of alcoholic vapour could be afterwards removed by water. The estimation must be made before any treatment of the gas, since benzene and other vapours, are soluble in caustic soda, cuprous chloride and other reagents. It is necessary to have the oxygen expelled from alcohol and water by saturation with coal gas.

In order to find out exactly what difference the prior removal of the hydro-carbon vapours would make, I analysed a sample of gas with and without removing them. The result is given below :—

TABLE 4.

	Ordinary method.	Bunsen method.
Hydrocarbon vapours	—	2·0
CO_2	1·0	0·7
O_2	0·8	0·7
C_nH_m	3·3	2·4
CO	8·0	7·0
CH_4	34·8	31·9
H_2	47·2	48·6
N_2	5·9	6·7
Cal. val. gross detd.	618·6	618·6
Cal. val. gross calc.	597·6	624·2

Note.—Hydrocarbon vapour assumed to have cal. val. 3738 B.T.U. per c. ft. ; C_nH_m, 2301 B.T.U. per cub. ft.

The result is interesting as showing that the 2 per cent. of hydrocarbon vapours unless previously removed contributes to the amount of gas absorbed in the various reagents and is left in sufficient quantity to materially affect the determination of the methane and hydrogen. The olefines show a decrease of one per cent. which is partly to be attributed to the bromine removing some of the vapour, while the caustic soda used to remove the excess of bromine vapour adds to the effect; and also to some absorption of ethylene in the alcohol. The carbon-monoxide is affected to a similar extent. The vapour which has survived the absorbents in the first case is much richer in carbon than methane and this throws the calculation of the hydrogen out.

The apparent discrepancies shown in the analysis of gas passed through tar described above are evidently the result of varying amounts of the hydrocarbon vapours, so that instead of carbon monoxide being apparently dissolved by passing gas through tar it is merely due to abstraction of hydrocarbon vapour by the tar. A paper published in the Journal of the American Chemical Society for 1908 by Dennis and M'Carthy recommends the use of an ammoniacal solution of nickel cyanide for estimating benzene in coal gas. The solution, however, has to be used after the absorption by caustic soda, leaving the latter free to absorb any hydrocarbon vapours. The solution also does not absorb homologues of benzene.

It seems a great pity that modern authors seem to have overlooked the presence of these vapours. In fact in one book published in 1911 dealing with the subject, one finds benzene classed with the unsaturated hydrocarbons and assumed to be absorbed by bromine. Benzene, of course, is a saturated compound (the aromatic compounds corresponding to ethylene, and acetylene, are cinnamene and phenyl-acetylene) which is only very slightly attacked by bromine under specific conditions. Moreover, there is as Bunsen and others have pointed out, a great physical distinction between the hydrocarbon vapours and the permanent gases, ethylene, propylene, etc., and for that reason it is most desirable to estimate them separately. The gas-manager, for example, need not trouble about the olefines once they are formed, but the utmost care must be taken if the hydrocarbon vapours are not to be lost in the purification. On the other hand it is difficult to see how a correct gas analysis can be made unless these vapours are removed beforehand.

In order to complete the investigation, a similar series of experiments to those described above were made, except that the hydrocarbon vapours were separated by means of alcohol in the analysis. The results are given in Table 5 and need little explanation, though it might be remarked that the gas passed through tar at 60° C. has a greater calorific value than the original gas, which was not so in the former case till the tar reached a temperature of over 70° C. This is of course because the tar and gas were separated in the works at a lower temperature in the latter case.

TABLE 5.—*Tar and gas separated at 52° C.*

	Without tar.	Tar at 15° C.	Tar at 60° C.
Cal. val. gross detd.	532·3	523·3	542·2
Hydrocarbon vapours	1·3	0·5	1·6
CO_2	0·1	0·1	0·1
O_2	0·2	0·2	0·2
C_nH_m	2·4	2·4	2·4

Summary. It has been shown above that serious errors may be introduced into an analysis of coal gas if the hydrocarbon vapours are not first removed. Alcohol may be used for this purpose and distinction is then made between these vapours, and the olefine gases subsequently absorbed by bromine. A small amount of ethylene is absorbed by the alcohol. Unless an allowance is made for these vapours, of which the chief constituent is benzene, the calculated calorific value is likely to differ very considerably from the determined value. Although insufficient data is at present to hand regarding the calorific power of the vapours absorbed by alcohol, yet seeing that they consist largely of benzene the constant will approach that of benzene. It is also evident that the value taken for the olefines, 2301 B.T.U. per cub. ft. or sometimes higher) and which has been used to cover the calorific value of the hydrocarbon vapours, which have not usually been estimated, will be too high. In this connection the work of Lebeau and Damiens, who found in the Paris gas about 2 per cent. of ethylene and only about one-half per cent. of propylene, is of interest as indicating that the calorific value of the gases absorbed by bromine is more likely to approach that of the former than the latter. Variation in the amount of hydrocarbon vapour present in different gases is more likely to occur than the large variations in the composition of the olefines which has been often assumed to account for discrepancies between calculated and determined values.

It has been again pointed out that the hydrocarbon vapours form a distinct class of substances to the olefine gases, and these vapours are responsible for an appreciable item in the total calorific value. To ensure these vapours being present in as large an amount as possible, the gas should be removed from the tar as hot as other factors will allow, since there is an equilibrium between tar, gas, and vapour, depending on the temperature (provided other conditions are similar) at which they are in contact. It is not likely that sufficient vapour will be obtained under ordinary carbonising conditions to saturate the gas at the ordinary atmospheric temperature, and if it be so the liquid condensed on cooling would prove a useful solvent for any solid naphthalene which may be deposited.

In conclusion, I desire to express my thanks for the courtesy of Mr. T. Hardie in connection with this investigation.

Journal and Patent Literature.

Patent Specifications may be obtained by post by remitting as follows :—

English.—8d. each, to the Comptroller of the Patent Office, W. Temple Franks, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1s. each, to the Secretary of the Society.

French.—1 fr. 05 c. each, as follows: Patents dated 1902 to 1907 inclusive, Belin et Cie., 56, Rue des Francs Bourgeois, Paris (3e.); Patents from 1908 to date, L'Imprimerie Nationale, 87, Rue Vieille du Temple, Paris.

German.—1 mark each (with full particulars) to Kaiserlich Patentamt, Berlin, Germany.

I.—GENERAL PLANT ; MACHINERY.

Patents.

Evaporation of saturated solutions ; Apparatus and process for the —— and for the utilisation of the produced vapours. J. B. Vincent, Hamburg, Germany. Eng. Pat. 24,590, Oct. 28, 1912.

Steam under pressure, produced in a suitable generator, actuates a steam jet injector, which exhausts the vapour from the evaporator and forces it into the generator, wherein it is heated and then delivered at a suitable pressure and temperature to the heating coil of the evaporator. The steam generator may be divided into two portions, in one of which, part of the vapour is superheated to a higher degree and used for driving a steam engine, the exhaust steam from which may be passed to the heating coil of the evaporator.—A. S.

Evaporating apparatus. W. A. Seltmann, New Rochelle, N.Y. U.S. Pat. 1,079,669, Nov. 25, 1913.

Liquid is delivered into a suitably heated tank, in which it is evaporated to a paste which is removed by a screw conveyor and discharged on to an endless band conveyor in a second drying chamber. The band conveyor travels first horizontally and then vertically downwards, and a pair of brushes detaches the dried material from the vertical portion and delivers it to the discharge opening. —W. H. C.

Evaporating device rotating in a vessel partly filled with heated liquid. W. Greding. Ger. Pat. 266,970, June 5, 1912.

The rotating device consists of a cylinder composed of several layers of wire netting or gauze, which dips in the liquid and thus exposes a large surface of the latter. Any foam produced is retained by the gauze and carried below the surface of the liquid.—A. S.

Gases : Apparatus for the purification of furnace ——. C. T. A. H. Eckhardt, Hamburg, Germany. Eng. Pat. 26,655, Nov. 20, 1912.

In apparatus of the kind in which the gases pass through a number of horizontal drums in which a scrubbing liquid is agitated by paddles or dashers on a horizontal shaft, the connections are arranged so that the gases enter each drum near the periphery and leave near the axis.—A. T. L.

Drying apparatus ; Tunnel ——. W. Yates and Matthews and Yates, Ltd., Swinton. Eng. Pat. 27,349, Nov. 28, 1912.

A mixture of cool atmospheric air with highly heated furnace gases is drawn into the discharge end of a drying tunnel by an exhaust fan situated at the opposite end, the material to be dried being carried through the tunnel in trucks. A single fan may control the gas flowing through two parallel tunnels.—H. H.

Heating, cooling or drying grain or granular substances : Apparatus for ——. E. Samuelson, Banbury, and J. Backhouse, Bootle. Eng. Pat. 28,609, Dec. 12, 1912.

In apparatus in which the grain is passed down a tower across which a series of rows of horizontal pipes are arranged through which the heating or cooling agent is circulated, in order to increase the efficiency each alternate row of pipes is arranged at an angle with the next, and every row is so arranged that the spaces between the pipes in one row are vertically below or above the pipes in the row next but one.—W. H. C.

Desiccating liquids ; Apparatus for ——. C. E. Gray, Eureka, and A. Jensen, Oakland, Cal. U.S. Pat. 1,078,848, Nov. 18, 1913.

Heated air is introduced tangentially into a cylindrical chamber with a conical bottom and is withdrawn axially, whereby vortex currents are set up. The liquid to be desiccated is discharged in an atomised condition into the centre of the vortex currents, and the separated solid particles fall to the bottom of the cone and are withdrawn.—W. H. C.

Raising and forcing liquids ; Automatic apparatus for ——. C. R. B. Brown, London. Eng. Pat. 27,561, Nov. 30, 1912.

To secure greater efficiency in apparatus of the "Hero's" fountain type in which air is compressed by liquid which flows from an upper to a lower vessel, the air displaced from the upper vessel when the latter is being filled with liquid, instead of being allowed to escape, is compressed and forced into the lower vessel. When the upper vessel is filled the liquid is allowed to flow into the lower vessel, still further compressing the air and finally forcing it into the ejector, where it acts on the liquid and drives it up the rising main.—W. H. C.

Vessels in which inflammable liquid is employed ; Method and apparatus for protecting closed ——. Martini und Hüneke Maschinenbau-Akt.-Ges., and P. Güngerich, Berlin-Steglitz, Germany. Eng. Pat. 15,263, July 2, 1913.

Closed vessels for treating materials with inflammable liquids in presence of air mixed with an inert gas are provided with a safety device adapted to prevent the inflammable liquid from entering the vessel until the pressure of the gas mixture therein reaches a value corresponding to the quantity of protective gas sufficient to prevent the formation of an explosive mixture. When the inert gas is only available at atmospheric pressure, the safety device is controlled according to the degree of vacuum required in the vessel in order to draw in the necessary amount of inert gas.—H. H.

Scale from boilers ; Process of removing ——. T. R. Greenhorne, Glasgow. Eng. Pat. 17,462, July 30, 1913.

The boiler is filled with cold water, carbon dioxide is introduced, and the solution allowed to act, for example, for 48 hours, until the scale is loosened.—H. H.

Sintering ; Method of treating materials for ——. Q. Bent and E. Barnhart, Sparrows Point, Md., and J. B. Ladd, Ardmore, Pa. U.S. Pat. 1,078,988, Nov. 18, 1913.

Material having a tendency to cohere is broken up into a fine state of division and then distributed over the sintering hearth as a loose porous mass of uniform density. —W. H. C.

Filter media ; Process of dislodging slime cakes from ——. C. Butters, Oakland, Cal. U.S. Pat. 1,078,994, Nov. 18, 1913.

The cakes are rendered as dry as possible by continuing the suction after the cake is formed, the vacuum is then cut off, and the cakes are flooded with water from above and washed off the frames.—W. H. C.

Filter for sludges, especially lignite sludge. Ribbertsche Braunkohlen-, Brikett- u. Tonwerke Ribbert und Co. Ger. Pat. 266,910, March 13, 1913.

The sludge is distributed uniformly over a fixed horizontal filter-table, to the underside of which suction is applied, and the residual cake is removed by means of an endless band fitted with scrapers.—A. S.

Separating mixtures of liquids; Process for ——. A. Golodetz, Berlin, Assignor to B. Benedix, Hamburg. U.S. Pat. 1,079,004, Nov. 18, 1913.

A mixture of two liquids is treated with a suitable quantity of a third liquid which forms with one of the constituents a binary homogeneous mixture of minimum boiling point, lower than the boiling point of either of the constituents of the original mixture, and is then subjected to fractional distillation.—W. H. C.

Separation and recovery of specifically lighter liquids from a mixture of liquids of different densities; Apparatus for the ——. B. Lorenzen. Ger. Pat. 266,575, Jan. 5, 1913.

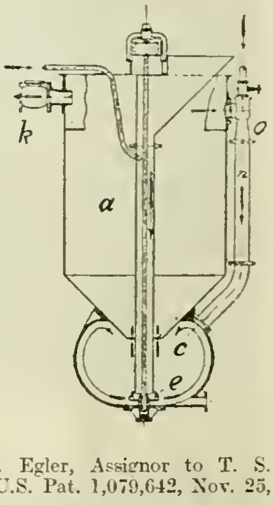
Water is introduced through a pipe into the vessel containing the mixed liquids in order to facilitate separation, and the lighter liquid overflows into an adjacent vessel. In the water supply pipe is an ejector connected with a closed receptacle, which in turn is connected with the vessel into which the lighter liquid overflows. The action of the ejector produces a vacuum in the closed receptacle and hence the lighter liquid is drawn up into the latter at a rate corresponding with the rate of supply of the water.—A. S.

Distilling liquids and fusible solids; Apparatus for ——. J. W. Aylsworth, East Orange, and F. L. Dyer, Montclair, N.J. U.S. Pat. 1,079,093, Nov. 18, 1913.

The materials to be distilled are passed down a vertical column packed with loosely arranged non-volatile material and heated by suitable jackets. The uncondensed distillation products are heated and circulated through the still to assist in carrying away the volatile matter.—W. H. C.

Dissolving sugar and other substances; Apparatus for ——. Maschinenfabrik Grevenbroich (vorm. Langen und Hundhausen). Ger. Pat. 266,335, Dec. 28, 1912.

The apparatus, which works continuously, comprises a dissolving vessel, *c*, and a settling vessel, *a*. The sugar or other material, is introduced at the upper end of the central vertical tube and the solvent, through the side tube connected therewith. The mixture of material and solvent is circulated in the dissolving vessel by means of the rotating device, *e*, in the direction shown by the arrows. The solution gradually rises in *a* and part of it is returned to *c* through the pipe, *n*, which is provided with means for conveying and heating it, *e.g.* with a steam injector, o. The clear solution is discharged continuously through the cock, *k*.—A. S.



Regenerative furnace. N. F. Egler, Assignor to T. S. Blair, jun., Chicago, Ill. U.S. Pat. 1,079,642, Nov. 25, 1913.

A by-pass is arranged between the gas inlet and waste gas outlet ports of the furnace so that part of the waste gas can be returned by means of a pump or fan and, without undergoing any chemical change, mixed with the fresh coke-oven or other gas entering the furnace.
—W. H. C.

Agitating liquids by means of compressed air or a liquid under pressure, with simultaneous heating. Dampfkessel- u. Gasometerfabrik A.-G. vorm. A. Wilke und Co. and Deutsche Teerproduktenvereinigung Ges. m. b. H. Ger. Pat. 266,344, Jan. 30, 1913.

The compressed air or liquid under pressure is introduced in the immediate vicinity of the heating surfaces by which the liquid to be agitated is heated.—A. S.

Vacuum crystallisers and the like; Hydraulic gear for ——. Maschinenfabrik Fritsch und Sohn. Ger. Pat. 266,458, Feb. 23, 1913.

The motion of the pressure cylinders of the hydraulic apparatus, one on either side of the drum, is transmitted to the crystallising drum by means of a wire rope or the like and pulleys, whereby it is possible to turn the drum through an angle of 180° or more.—A. S.

Vacuum; Production of a —— by means of low temperatures. J. E. Lilienfeld, Leipzig, Germany. Eng. Pat. 12,272, May 26, 1913. Under Int. Conv., Aug. 6, 1912.

See Fr. Pat. 458,346 of 1913; this J., 1913, 1094.—T. F. B.

Evaporating and distilling plant. W. Weir, Glasgow. U.S. Pat. 1,079,966, Dec. 2, 1913.

See Eng. Pat. 2813 of 1912; this J., 1912, 708.—T. F. B.

Fibres and the like from liquids; Apparatus for separating and recovering ——. E. V. Chambers and T. C. Hammond, Huddersfield. U.S. Pat. 1,079,975, Dec. 2, 1913.

See Eng. Pat. 7060 of 1912; this J., 1912, 837.—T. F. B.

Stirring and mixing liquids; Apparatus for ——. C. Still, Recklinghausen, Germany. U.S. Pat. 1,080,177, Dec. 2, 1913.

See Eng. Pat. 22,861 of 1910; this J. 1911, 941.—T. F. B.

Absorber and separator for gases and vapours. H. Hey, Dewsbury. U.S. Pat. 1,080,445, Dec. 2, 1913.

See Eng. Pat. 14,652 of 1912; this J., 1913, 780.—T. F. B.

Furnace. G. Wilton, Hendon. U.S. Pat. 1,081,073, Dec. 9, 1913.

See Eng. Pat. 15,459 of 1911; this J., 1912, 320.—T. F. B.

Separating substances of different specific gravities by means of a liquid of intermediate specific gravity; Process and apparatus for ——. A. Gründler. Fr. Pat. 460,225, July 10, 1913. Under Int. Conv., Oct. 29, 1912.

See Eng. Pat. 15,945 of 1913; this J., 1913, 1148.—T. F. B.

IIa.—FUEL; GAS; MINERAL OILS AND WAXES.

Oil wells; Premature abandonment of ——. Possibilities of revival. Times Eng. Suppl., Dec. 17, 1913.

The Bureau of Mines of the United States has issued the following, by L. G. Huntley, dealing with the possible causes of the decline of oil wells and with suggested methods of prolonging their yield.

Premature exhaustion.—A part at any rate of the premature exhaustion of the oilfields may be apparent rather than real. There are many circumstances which affect not only the yield of a particular well, but also the wells in a pool of considerable area, and a better understanding of these has enabled pools to be re-started which had been abandoned as exhausted.

Waxy sediment.—One of the most important factors governing the extent and rapidity of the decline of yield of oil wells, is the formation of waxy sediments that obstruct the passage of oil from the sand bed. The petroleum, as found *in situ*, consists chiefly of hydrocarbons ranging from solid wax to light gases, and a partial separation of wax may take place before the petroleum reaches the surface owing to the cooling produced by the rapid volatilisation of the gaseous constituents when the pressure is relieved. The separated wax combines with water and fine rock sediments, clogs the pores of the sand, obstructs the flow of the oil into the well, and is the cause of many failures of wells situated in unexhausted territory.

Loss of pressure. The uncontrolled escape of the gaseous hydrocarbons, besides interfering with the production of an oil well as described, has a further injurious effect from an economical point of view. Each cubic foot of gas in expanding should perform its quota of work by assisting in the expulsion of the liquid petroleum, at the same time retarding the flooding action of water for a considerable period, or until the maximum amount of oil has been recovered. An illustration of the fatal result which may happen if the gas is allowed to drain away too rapidly is afforded by the Hogshooter pool in Oklahoma, where wells were commonly drawn upon to their utmost capacity. The consequence of this practice was that the water under high pressure in the lower part of the productive formation, being unrestrained by the pressure of the gas, flooded one well after another and ultimately ruined the district.

Wasteful competition.—Much waste results from the extravagant methods of production employed by operators (with small leases especially), who fight each other for production. Instances of this are to be found in Oklahoma, where the short-term leases granted by the Government have tempted operators to drill uneconomically with a view to extracting the maximum amount of oil before the leases expire. Methods of this description are attended by many evils, such as drilling more wells than are necessary, pumping too fast, wasting gas pressure (and the gas itself), flooding wells, and pumping one well against another. These practices are not only wasteful in themselves, but also tend to create underground conditions favourable to the encroachment of water.

"*Coming back*" *of districts.*—In certain of the older Pennsylvania and West Virginian oilfields the apparent regeneration of the oil supply led to the belief that oil was continually being formed underground, and that exhaustion was impossible. This belief has caused the useless expenditure of large sums of money. At the same time the intelligent recognition of the true cause of the apparent regeneration points towards a real recuperation of oil areas which have been prematurely abandoned, or which give indications of failure. Many areas which have been rejected as possible sources of oil supply, after closer examination may yet be restored, and add considerably to the world's store of liquid fuel.

Crude oil for the assay furnace. W. G. Haldane. Eng. and Min. J., 1913, **96**, 1073—1074.

A TEST was made with a muffle furnace provided with two low pressure burners in which crude oil, under a head of 6 to 12 in., was atomised by means of an air blast from a 12 in. blower, the latter being driven by a ¼ h.p. high speed induction motor connected with an ordinary lighting circuit, and designed to deliver, through a 2 in. opening, 4000 cub. ft. of air per min. under a pressure of 4 to 5 oz. (7—8½ ins. of water). The furnace contained two muffles side by side, each provided with a separate burner and operated independently, one being used for crucible fusions and the other for cupellation. Both muffles were ready for use 30 mins. after starting, and, in 50 mins. from the start, 40 fusions were made with a total consumption of 1·6 galls. of oil, cupellation being subsequently effected in 35 mins. with an oil consumption of 0·9 gall. Texas crude oil, costing 6 cents (3d.) per gall. was used.—W. E. F. P.

Petroleum spirit (*gasoline*); *Production of —— from natural gas in Galicia.* B. Rozanski. Petroleum, 1913, **9**, 217—224.

ONLY gas that comes directly from the crude petroleum is suitable for the production of gasoline by compression and cooling. Natural gas which contains more than 40 per cent. by vol. of methane is termed "dry" gas and is quite unsuitable for condensation. The richest gas found in America yields about 106 litres of gasoline per 100 cb. m., but on the average not more than 40 to 46 litres are obtained. The Galician natural gases usually contain from 40 to 60 per cent. of practically uncondensable gases (mainly methane and air). A natural gas composed of 60 per cent. of benzine vapours and 40 per cent. of methane, yields in practice only about 15 per cent. of the calculated amount of condensed liquid (*e.g.*, 40 litres instead of 274 litres per 100 cb. m. of the mixture). At the present time the high price of motor spirit should make a yield of 5 litres per 100 cb. m. profitable, provided that the residual gas were used for heating. The original gas ought to have a sp. gr. of not less than 0·800, whereas the gases from the Boryslaw-Tustanowice wells showed a sp. gr. of barely 0·70, and yielded scarcely 2 litres of gasoline per 100 cb. m. In the condensation process the natural gas is first compressed at 3½ atmos. and subsequently at 14 to 28, or even 42 atmos. The cooling is effected by means of water or by the sudden expansion of the compressed gas itself. Good results have also been obtained with ammonia refrigerators. In another process the hot compressed gas leaving the compressors is conducted to the bottom of a steel container charged with naphtha of sp. gr. 0·745. Thence, after absorbing heavy benzine constituents from the naphtha, it passes into the coolers. In this way a heavier and more homogeneous product is obtained. The compressed gasoline is usually colourless or light brown. The American product formerly had a sp. gr. varying from 0·650 to 0·622 (0·720 in the Western oil fields), but that now prepared is usually of sp. gr. 0·730 to 0·770, or almost the same as the Galician gasoline. It consists, in the main, of butanes and pentanes, with a little propane and a certain amount of hexanes, heptanes and perhaps nonanes. Natural gasoline is used in America for mixing with the benzines and gasolines from the refineries for use as a motor spirit, but the mixtures are seldom homogeneous, and cause difficulties in use. A large amount is also used for lighting and heating purposes.—C. A. M.

Hydrocarbons of Utah. C. Bardwell, B. A. Berryman, T. B. Brighton and K. D. Kuhre. J. Ind. Eng. Chem., 1913, **5** 973—976.

THE mineral hydrocarbons which occur most abundantly in Utah are gilsonite, tabbyite, wurtzilite, ozokerite, and rock asphaltum. A brief description of the chief deposits and a review of the literature are given. Some of the uses of the minerals are as follows: Gilsonite (production, 50,000 tons in 1912): paving industry, electrical insulators, roofing materials, waterproofing pipes and aqueducts, preventing corrosion of iron plates of ships' bottoms, coating wire fencing, sea walls, poles, etc., lining tanks for chemicals, paints for smoke-stacks, lubricant for heavy machinery, rubber substitute, binder for briquettes. Tabbyite: compositions for rubber floor mats, rubber paints and roofing materials, filler for rubber mixings for tyres, etc. Wurtzilite (production, 1000 tons per annum): varnishes, roofing compositions, etc. Ozokerite: electrical insulators, altar candles, substitute for beeswax, ointments and the like, waterproofing mixtures, wax dolls, telephone receivers, phonograph records, polishes, electroplating, crayons, sealing wax, etc. Rock asphaltum: paving industry. The results of an experimental investigation of the mineral hydrocarbons mentioned are given chiefly in tables, of which the following shows the solubility of the different materials in various solvents, together with corresponding figures for refined Trinidad pitch and Bermudez asphaltum :—

	Trinidad pitch.	Bermudez asphaltum.	Gilsonite.	Tabbyite.	Wurtzilite.	Ozokerite.	Rock asphaltum.

Extinguishing fires in lacquer [and gasoline] with sawdust. *See* XIII.

PATENTS.

Briquetting and similar installations; Apparatus for the removal and utilisation of dust in ——. C. Fischer. Ger. Pat. 266,400, Nov. 26, 1912.

The usual dust collectors are connected by a conduit with a special dust separator and the latter with the feed hoppers for the briquetting machine or with a screw conveyor leading to the same; and a high vacuum is used for conveying the dust from one part of the system to another, in order to avoid risk of fire or explosions.—A.S.

Coke, Manufacture of ——. J. Moeller and H. C. Woltereck, London. Eng. Pat. 28,791, Dec. 14, 1912.

Coal, coal dust, slack, lignite, etc., is heated in retorts to 400°—600° C., and highly superheated steam at a pressure of not more than 4 to 5 lb. per sq. in. is passed through the retorts, whereby the coking period is shortened and the yield of volatile products is increased.—A. T. L.

Coke-oven. W. M. Person, Sparrows Point, Md. U.S. Pat. 1,079,062, Nov. 18, 1913.

The combustion flues in the dividing walls between the coking chambers receive gas from separate regenerators, which are connected in groups with a number of primary regenerators.—A. T. L.

Coking coal; Apparatus for ——. H. L. Doherty, New York. U.S. Pat. 1,080,142, Dec. 2, 1913.

The coal is subjected to the direct heating action of a flame produced by the introduction of gas and air into a clear space above the coal in the heating chamber. The lower end of the coking chamber opens into a larger chamber forming a surrounding annular gas chamber at the sides and having a hopper at the bottom leading into a quenching chamber and discharge grate.—H. H.

Gas and coke; Apparatus for making ——. H. Nelsen, Essen-Rüttenscheid, Germany. Eng. Pat. 26,302, Nov. 15, 1912. Under Int. Conv., May 17, 1912.

Regenerators for preheating the air supplied to the inner heating flues of a vertical annular retort are arranged in the central vertical space.—W. H. C.

[Oil] Gas generator. O. H. Ensign, Madison, Wis. U.S. Pat. 1,079,118, Nov. 18, 1913.

Liquid fuel and air under pressure are supplied to a chamber in which gas is generated by the heat liberated by the combustion of part of the fuel. The fuel supply is kept at a constant temperature by a thermostatic device. The fuel injector may be arranged so that the quantity of fuel supplied depends either on the pressure in the gas-generating chamber, or on the difference between that pressure and the pressure of the air supply. Means are provided for "varying the pressure in the chamber relatively to the pressure of the air supply for variations in the quantity of gas produced and for a constant rate of gas production."—A. T. L.

Gas producer. C. M. Garland, Collingswood, N.J., Assignor to Camden Iron Works, Camden, N.J. U.S. Pat. 1,079,234, Nov. 18, 1913.

The fixed upper section of the producer is supported by a framework above a rotating body-portion and a fixed base with annular water-sealed ash-pit and central tuyère. The upper section carries an upward extension of reduced diameter arranged at one side and provided with a charging hopper and a gas outlet connection. A series of slicing-bars, adjustable vertically in the bed of fuel, are supported from a beam carried by the framework above the producer.—A. T. L.

Gas cleaner. A. Ernst, Pittsburgh, Pa. U.S. Pat. 1,079,849, Nov. 25, 1913.

A vertical cylindrical casing supported above a water trough which seals the lower end, is provided with a number of flanges inclined inwards and downwards, the lowest of which has an extension forming an inner cylindrical wall with serrated lower edge just reaching to the water level. The gas is admitted to the annular chamber between this inner wall and the outer casing, and passes through the water-seal into the inner compartment. The gas as it passes up through the casing meets a descending spray of water produced by a jet in the upper part of the casing and a number of rotating fan blades between the inclined flanges. It is finally dried by passing up through suitable material supported on grids in the upper part of the apparatus.—A. T. L.

Hydrocarbon mixtures; Treatment of liquid ——. R. Hense, Charlottenberg. Eng. Pat. 6643, March 18, 1913.

The distillation of the mixture of hydrocarbons, oxidising agents or nitro-compounds, and gum or resin as described in Fr. Pat. 384,946 (this J., 1908, 494) is interrupted when a temperature ranging from about 200° C. to 300°—350° C., according to the composition of the mixture, is reached: the residue is cooled, treated with ozone as concentrated and as free from nitrogen as possible, and after separating any sediment, the distillation continued.—W. H. C.

Gasolene jelly; Process of making ——. J. E. Mitchell, New York. U.S. Pat. 1,079,257, Nov. 18, 1913.

Castile soap, 2 parts, is dissolved and mixed with chloroform, 1 part, glycerin, 2 parts, and ammonia, 1 part. Water, 32 parts, is added to this mixture, the product agitated with 32 times its quantity of gasolene until it solidifies, and the solid product agitated with 16 to 24 times its weight of gasolene.—A. T. L.

Nitrous compounds from mixtures of petroleum and tar; Process for preparing ——. A. Flexer. Fr. Pat. 460,280, July 12, 1913. Under Int. Conv., July 13, 1912.

A mixture of purified petroleum and tar (*e.g.*, 40 parts of purified lamp oil and 6 parts of vegetable tar) is treated with concentrated nitric acid (10 parts); after some hours, the solid resinous mass is separated from the oily liquid, which contains the nitrogenous compounds. The oily product is miscible with oils and with glycerin, and is stated to be emulsifiable with water, especially in presence of alcohol, and to be suitable for use as a disinfectant. The solid product, which is also nitrogenous, can be vulcanised, giving a product somewhat similar to rubber.—T. F. B.

Benzene from petroleum or its distillates. Process for obtaining ——. J. Holegreber. Fr. Pat. 460,827, July 28, 1913.

The vapours of petroleum or its distillates are mixed with hydrogen and passed through metal or other tubes containing catalytic substances, such as suitable metals. The tubes are heated to a temperature of 180°—300° C. The benzene is extracted from the resulting vapours either by physical means or by combining it with aluminium chloride.—T. F. B.

Fuel such as coal and coke; Process for briquetting —— *with paper flock or scraps of paper added in the dry state.* F. Reinold. Fr Pat. 460,942, July 2, 1913.

See Ger. Pat. 266,457 of 1912; this J., 1913, 1149.—T.F.B.

Oil-gas for internal combustion engines; Apparatus for and method of generating ——. F. H. Bates, Philadelphia. Eng. Pat. 29,277, Dec. 19, 1912.

See U.S. Pat. 1,046,541 of 1912; this J., 1913, 77.—T. F. B.

Gas from sewage; Apparatus for the production of ——. C. Birault, Paris. U.S. Pat. 1,080,808, Dec. 9, 1913.

See Eng. Pat. 13,009 of 1912; this J., 1913, 448.—T. F. B.

Coal gas; Method for removing or recovering certain substances from ——. G. H. Hultman, Stockholm. Eng. Pat. 11,758, May 20, 1913.

See U.S. Pat. 1,073,605 of 1913; this J., 1913, 971.—T. F. B.

Tar and ammonia from gases; Recovery of ——. C. Still, Recklinghausen, Germany. U.S. Pat. 1,080,938, Dec. 9, 1913.

See Eng. Pat. 28,072 of 1912; this J., 1913, 590.—T. F. B.

Gas-washer. A. H. Lymn, Westminster. U.S. Pat. 1,081,241, Dec. 9, 1913.

See Eng. Pat. 744 of 1913; this J., 1913, 1147.—T. F. B.

Production of ferrocyanides. [*Recovery of hydrogen cyanide from retort gases.*] Eng. Pat. 27,908. *See* VII.

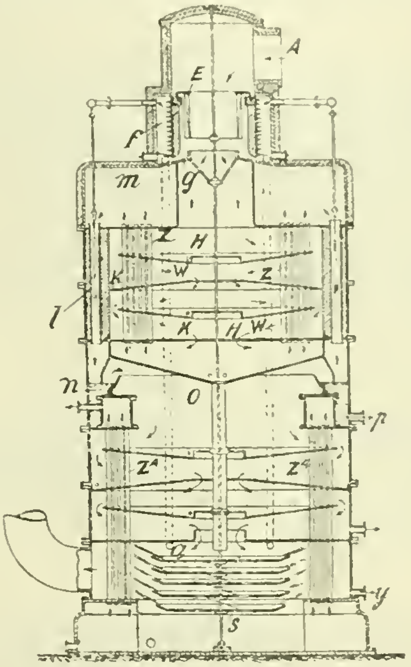
Patents.

Gases from the distillation of carbonaceous substances; Apparatus for the recovery of by-products from ——. J. G. Aarts. Ger. Pat. 266,603, Oct. 31, 1911.

The gas enters the apparatus at A and the tar is separated by a centrifugal device, E, and flows away through *g*. A warm solution of a suitable chemical is introduced into *f*.



The gas passes on to the chamber, H, provided with partitions, *w*, whereby the gas is caused to circulate around the tubes, Z, after which it passes upwards into *m* and then downwards through the conduits, *l*, to which also the solution from the chamber, *f*, is led. Condensed products which separate from the gas in H are led off through the tubes, K. The mixture of liquor and gas from the conduits, *l*, collects in *n*; the gas passes on into the chamber, O, whilst the liquor is discharged through *p*. The tubes, Z^A, in O are cooled by water. The gas is finally discharged from the lowest chamber, *q*. The tar separated in the upper part of the apparatus may be led into *q*, where it is finely divided by the centrifugal device, *s*, thus enabling the tar oils to absorb any benzol still present in the gas. The lighter tar oils, with the absorbed benzol, may be withdrawn through *y*, or the tar as a whole may be allowed to flow out at the bottom.—A. S.

Peat; Process for treating and utilising ——. J. W. Leadbeater. Fr. Pat. 461,092, Aug. 4, 1913. Under Int. Conv., Aug. 13, 1912.

See Eng. Pat. 18,587 of 1912; this J., 1913, 820.—T. F. B.

III.—TAR AND TAR PRODUCTS.

Catalytic reactions at high temperatures and pressures. XXVI. Hydrogenisation of phenols with unsaturated side chains. W. Ipatiew. Ber., 1913, 46, 3589—3593.

In the presence of reduced nickel at 100° C. and about 30—50 atmospheres pressure, phenols with unsaturated

side-chains took up hydrogen to yield phenols with saturated chains. On raising the temperature to about 200° C., this was followed by the addition of six atoms of hydrogen to the benzene nucleus; and also when the phenols were polyhydric by the reduction of methoxy- or hydroxy groups until at most one such group was left. Anethol gave dihydroanethol at 95° C. and hexahydropropylbenzene at 200° C. Eugenol and isoeugenol yielded dihydroeugenol at 92° C. and a mixture of octohydroanethol and octohydroeugenol at 195° C. Methyleugenol gave as final product octohydroanethol. Safrol and isosafrol yielded the same dihydrosafrol at 93° C., and on further reduction an isomeride of octohydroanethol.
—W. H. P.

Methylnaphthalenes. R. Lesser. Annalen, 1913, **402**, 1—51.

The methylnaphthalenes, which are now prepared on a commercial scale in a state of great purity, were nitrated. The α-compound gave a mono- and a trinitro-derivative and the β-compound a mono- and a dinitro-derivative, the mono-nitro derivatives being identified by their corresponding carboxylic acids. The aminomethylnaphthalenes were prepared together with their salts, acetyl- and benzoyl-compounds and phthalimides. 1.4-Aminomethylnaphthalene was condensed with dinitrochlorobenzene and with picryl chloride, but the 1.2-aminomethylnaphthalene only formed addition products with these. The naphthols and quinones were prepared, and also azo-dyestuffs were made from the two aminomethylnaphthalenes.—G. H. F.

Pyrene; A synthesis of ——. M. Freund and K. Fleischer. Annalen, 1913, **402**, 77—81.

The dianhydride of 1.8.4.5-naphthalenetetracarboxylic acid was heated for 3 hours at 170° C. with four times its weight of the diethyl-ester of malonic acid together with twice its weight of zinc chloride, whereby 5.10-diketo-3.8-dihydroxypyrene was formed, which on distillation with zinc dust gave pyrene, recognised by its characteristic picrate, m. pt. 223° C.—G. H. F.

Patent.

Plastic, rubber-like mass suitable for tarring roads and for other purposes; Process for making a ——. Soc. Anon. des Combustibles Industriels. Fr. Pat. 460,943, July 2, 1913. Under Int. Conv., Oct. 28, 1912.

A product very suitable for use in tarring roads, and stated to be insusceptible to atmospheric influences, is obtained by removing from tar the "excess" of naphthalene and naphthalene oils and creosote oils, heating the residue to 90°—200° C., adding anthracene or anthracene oils, and blowing air through the product until the desired consistency is reached.—T. F. B.

Hydrogenation [and reduction]; Catalytic process for ——. A. Brochet. First Addition, dated Oct. 8, 1912, to Fr. Pat. 458,033, July 27, 1912 (see this J., 1913, 1031).

The process of hydrogenation and reduction described in the principal patent can be modified by addition of catalysts of the second order, or of acids or alkalis, etc., in such a way as to modify the velocity of the reaction or to produce different products. Thus, reduction of nitrobenzene by aid of reduced nickel as described gives rise to aniline alone; when caustic soda is present, azoxybenzene is the principal product, whilst this, in turn, is reduced to aniline in neutral media and to azobenzene in presence of caustic soda. The azobenzene can be further reduced to hydrazobenzene in presence of alkali.—T. F. B.

2-Methylanthraquinone; Chloro derivatives of ——. Act.-Ges. f. Anilinfabr. Fr Pat. 460,432, July 16, 1913. Under Int. Conv., Jan. 24 and July 11, 1913.

It is known that 2-methylanthraquinone is converted into chloromethyl derivatives by heating with chlorine under pressure. It has now been found that chloro-methylanthraquinones, containing the chlorine in the anthraquinonyl nucleus, are obtained if 2-methylanthraquinone or a derivative is treated with chlorine or its equivalent in presence of a catalyst, such as iodine. For example, 1-chloro-2-methylanthraquinone is obtained by heating on the water-bath under a reflux condenser, a mixture of 15 parts of 2-methylanthraquinone, 25 parts of nitrobenzene, one part of iodine, and 15 to 20 parts of sulphuryl chloride; the reaction is complete in 8 to 10 hours, and the product is separated by crystallisation and addition of alcohol.—T. F. B.

Aminoanthraquinonesulphonic acid; Process for preparing an ——. Chem. Fabr. Griesheim-Elektron. Fr. Pat. 460,048, July 4, 1913. Under Int. Conv., Dec. 11, 1912.

See Eng. Pat. 15,028 of 1913; this J., 1913, 937.—T. F. B.

Preparing nitrous compounds from mixtures of petroleum and tar. Fr. Pat. 460,280. *See* IIa.

Obtaining benzene from petroleum or its distillates. Fr. Pat. 460,827. *See* IIa.

IV.—COLOURING MATTERS AND DYES.

Anthocyans; Researches on the ——. *I. The colouring matter of the cornflower.* R. Willstätter and A. E. Everest. Annalen, 1913, **401**, 189—232.

The anthocyans are the blue, violet and red dyestuffs, soluble in water and dilute alcohol but insoluble in ether, which occur in flowers, many fruits and some leaves. They correspond to the yellow plant dyestuffs investigated by A. G. Perkin, to which latter may be given the group name anthoxanthins. The anthocyan of the cornflower exists in different forms in different parts of the plant—a violet form which is the free acid and to which the name *cyanin* is given, a blue form which is the potassium salt, a red form which is an oxonium salt, and a colourless form which results when an aqueous extract of the flower is allowed to stand. The formation of the colourless form can be prevented by adding sodium chloride or sodium nitrate to the solution. The dyestuff, which exists to the extent of about 0·66 per cent. in the dried cornflowers, is isolated by extraction with water or dilute alcohol. It is purified by fractional precipitation with alcohol and finally by crystallisation of the cyanin hydrochloride from alcoholic hydrochloric acid. The product is a glucoside of the formula, $C_{28}H_{33}O_{17}Cl+3H_2O$, and it yields 2 mols. of dextrose and 1 mol. of cyanidin hydrochloride, $C_{16}H_{13}O_7Cl$, on hydrolysis. The salts of cyanidin, unlike those of the glucoside, are soluble in amyl alcohol. Unlike the natural yellow dyestuffs, cyanidin contains a strong salt-forming oxygen atom, probably in a quinonoid ring. Its salts are therefore oxonium salts—the first found in nature, probably. The colour of the anthocyans is dependent on the oxonium group and the decolourisation of solutions on standing or heating, which is a characteristic of this group, appears to be due to the wandering of two atoms of hydrogen, one of which goes off with the anion (*e.g.*, Cl), the other reducing the quinone ring.—J. B.

Methylnaphthalenes. Lesser. *See* III.

Patents.

Carbazole derivatives; Manufacture of ——. R. B. Ransford, London. From L. Cassella und Co., G. m. b. H., Frankfort, Germany. Eng. Pat. 28,076, Dec. 5, 1912.

Leuco-compounds of indophenols of the carbazole series are produced by treating with sulphites the indophenols derived from *p*-nitrosophenols and carbazole or its N-substituted derivatives. Thus, 4-hydroxyaryl-3-amino-carbazole-monosulphonic acid is obtained by the action of neutral sodium sulphite on the indophenol from carbazole and *p*-nitrosophenol.—T. F. B.

Monoazo dyestuffs for wool; Manufacture of ——. The Mersey Chemical Works, Ltd., London, and F. Ackermann, Berlin-Friedenau, Germany. Eng. Pat. 16,537, July 18, 1913. Addition to Eng. Pat. 13,304, March 3, 1911 (see Fr. Pat. 430,146 of 1911; this J., 1911, 1246).

Dyestuffs which dye wool yellow to orange shades, fast to washing, are obtained by combining diazotised 2.5-dichloroaniline-4-sulphonic acid with a non-sulphonated alkyl-aralkylarylamine of the benzene series, *e.g.*, ethylbenzylaniline.—T. F. B.

Wool dyestuffs of the anthraquinone series, Manufacture of ——. Act.-Ges. f. Anilinfabr., Treptow, Germany. Eng. Pat. 16,827, July 22, 1913. Under Int. Conv., July 23, 1912.

Pyridazone-1-halogenanthrones (see Fr. Pat. 440,303 of 1912; this J., 1912, 809) are treated with ammonia or aliphatic amines; when unsulphonated pyridazonehalogenanthrones are used, it is advisable to use the arylsulphonyl compounds of the bases instead of the free bases, and to remove the acidyl group subsequently. In either case the products are converted into clear yellow or greenish-yellow wool dyestuffs by sulphonation.—T. F. B.

[Azo] *dyestuffs which produce violet to blue shades on the fibre; Process for making* ——. Farbenfabr. vorm. F. Bayer und Co. First Addition, dated June 25, 1913, to Fr. Pat. 442,697, March 25, 1912. Under Int. Conv., July 23, 1912.

Dyestuffs which produce bluer shades than those described in the principal patent (see Eng. Pat. 9433 of 1911; this J., 1912, 182) are obtained by combining one mol. of a diazoazo compound which contains no amino- or hydroxy-group and one mol. of the diazo compound of 2.5.7- or 2.8.6-aminonaphtholsulphonic acid or their 1-chloro-derivatives, with 2.2′-dinaphthylamine-5.5′-dihydroxy-7.7′-disulphonic acid. The dyestuffs thus produced are developed on the fibre by means of diazotised nitraniline: the resulting violet to blue shades are fast to washing and can be discharged to pure white by hydrosulphites. In a detailed example the diazo-compound obtained from diazotised *p*-nitrobenzene-*o*-sulphonic acid-azo-1-naphthylamine-7-sulphonic acid is given as the diazoazo compound.—T. F. B.

2-*Nitroquinizarin; Process for preparing* ——. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 461,094, Aug. 4, 1913. Under Int. Conv., Aug. 12, 1912.

The treatment of quinizarin with concentrated nitric acid, alone or in presence of sulphuric acid, results in the formation of nitropurpurin, whilst treatment with nitric acid in presence of boric acid or other substance which prevents oxidation, produces no nitration. On the other hand, a new product, 2-nitroquinizarin, is easily obtained by the action of nitric acid on quinizarin in presence of an inert solvent or diluent, such as glacial acetic acid or nitrobenzene. The product consists of brick-red crystals, which dissolve in sulphuric acid to a cerise-red solution without fluorescence: the dyeings on alum-mordanted wool are claret to brown, and on chrome-mordanted wool violet-brown to brown.—T. F. B.

Dyestuffs for wool; Process for making yellow to brown ——. Farbwerke vorm. Meister, Lucius, und Brüning. First Addition, dated June 17, 1913, to Fr. Pat. 443,809, May 14, 1912 (see this J., 1912, 979). Under Int. Conv., July 6, Oct. 19, and Nov. 16, 1912.

See Ger. Pat. 265,197 of 1912; this J., 1913, 1101. The *p*-aminodiphenylaminesulphonic acid may also be replaced by an aminophenylnaphthylaminesulphonic acid or a derivative thereof.—T. F. B.

Colouring matter suitable for alimentary and other products; Preparation of a harmless ——. P. D. Jacquemin. Fr. Pat. 460,441, Oct. 5, 1912.

The colouring matter is extracted from wine lees by means of acetone, the extracts are evaporated, and the residue treated with sulphuric acid until a soluble product is produced. The resulting colouring matter is said to be especially suitable for colouring food products, but it may also be used for dyeing.—T. F. B.

Disazo dyestuffs for cotton, Process for preparing yellow ——. Chem. Fabr. Griesheim-Elektron. Fr. Pat. 461,039, Aug. 1, 1913. Under Int. Conv., Jan. 7 and 9 1913.

The tetrazo compound of *m*-tolidine or of *mm′*-dichlorobenzidine is combined with two mols. of a 1-aminophenyl-5-pyrazolone-3-carboxylic acid or of a 1-nitrophenyl-5-pyrazolone-3-carboxylic acid; in the latter case the nitro groups are reduced. The products dye cotton yellow to reddish-yellow shades, which are transformed into orange or bright red by diazotisation on the fibre and development with β-naphthol.—T. F. B.

Sulphur [sulphide] dyes; Manufacture of ——. P. A. Newton, London. From Farbenfabr. vorm. F. Bayer und Co., Elberfeld, Germany. Eng. Pat. 4676, Feb. 24, 1913. Addition to Eng. Pat. 11,776, May 17,1912.

See Fr. Pat. 449,983 and Ger. Pat. 264,293 of 1912; this J., 1913, 480, 1004.—T. F. B.

Mordant dyestuffs; Manufacture of green ——. Farbwerke vorm. L. Durand, Huguenin und Co., Basle, Switzerland. Eng. Pat. 14,860, June 27, 1913. Under Int. Conv., July 26, 1912.

See Fr. Pat. 459,681 of 1913; this J., 1913, 1101.—T. F. B.

Vat [anthracene] dyestuff. A. L. Laska and E. J. Rath, Offenbach, Assignors to Chem. Fabr. Griesheim-Elektron, Frankfort on Maine, Germany. U.S. Pat. 1,079,568, Nov. 25, 1913.

See Eng. Pat. 12,152 of 1913; this J., 1913, 906.—T. F. B.

Sulphide dyestuffs for cotton; Process for producing yellow and brown ——. L. Cassella und Co. G. m. b. H. Fr. Pat. 460,256, Sept. 30, 1912.

See Eng. Pats. 22,453 and 29,970 of 1912; this J., 1913, 862.—T. F. B.

V.—FIBRES; TEXTILES; CELLULOSE; PAPER.

Patents.

Flax and similar straws; Process of retting ——. The Fibre Corporation, Ltd. Fr. Pat. 460,092, July 7, 1913.

The stems of flax are packed vertically in a reservoir into the top of which a slow and uniform supply of warm water is admitted and forced to travel through the material in currents parallel to the length of the stems, being drawn off at the bottom together with the products extracted by retting. The layer of water which covers the stacks of stems in the reservoir is given a horizontal circulatory motion to ensure uniform distribution and the speed of the downward current is controlled by adjusting the outlet orifices in the bottom of the tank.—J. F. B.

Wood for the manufacture of sulphite cellulose or mechanical pulp; Process for extracting resins from ——. D. Rosenblum, L. Brech and E. Tyborowski. Fr. Pat. 460,472, July 17, 1913.

The wood is digested for 1—5 hours at about 110° C. with water containing solvents of resin capable of forming emulsions or with a solution of ammonia or a mixture of both reagents. The reagents are employed in proportions of 0·5—2 per cent. of the weight of the wood.—J. F. B.

Celluloid, acetyl-cellulose and the like articles ; Process for cleaning and renewing ——. A. Püschel, Leitmeritz, Austria. Eng. Pat. 18,105, Aug. 8, 1913. Under Int. Conv., Jan. 20, 1913.

Celluloid articles which have become dull are immersed for a short time in "English sulphuric acid" at the ordinary temperature, washed, dried and preferably, but not necessarily, steeped in strong alcohol for 15—30 minutes, being finally varnished with one or more coats of camphor-collodion.—J. F. B.

Plastic material [*from soy beans*] *capable of replacing celluloid, suitable for finishing, spinning and weaving ; Transparent, flexible, non-inflammable* ——. P. J. Contant and J. B. F. Perrot. Fr. Pat. 461,007, Aug. 1, 1913.

The latex of the seeds of *Soja hispida* is treated with bases, *e.g.*, ammonia, soda or pyridine in the proportion of 5—10 grms. per litre ; 10—15 grms. of a mixture of acetic, lactic, phosphoric and nitric acids are added at a temperature of 35° C. The material is then heated to boiling in a solution of aluminium sulphate and the reaction is allowed to proceed for 2—8 days. The plastic product obtained is gelatinised by solvents, such as pyridine, acetic acid and resorcinol and may be hardened by formaldehyde.—J. F. B.

Acetylcellulose ; Process for spreading coatings of —— *on fabrics or other materials.* Act.-Ges für Anilin-Fabrikation. Fr. Pat. 461,058, Aug. 2, 1913. Under Int. Conv., Nov. 15, 1912.

The material is coated with a solution of acetylcellulose or nitro-acetylcellulose in a mixture of 90 parts of tetrachloroethane and 10 parts of amyl alcohol or fusel oil. As the two solvents evaporate at an approximately equal rate, the uniform distribution of the coating is facilitated. —J. F. B.

Esparto grass, etc., for paper making ; Bleaching of ——. F. W. Dobson, Tamworth. Eng. Pat. 27,188, Nov. 26, 1912. Addition to Eng. Pat. 3181, Feb. 8, 1911 (this J., 1912, 225).

Esparto grass, boiled and washed in the usual way, is brought into a dry or semi-dry condition and then introduced into a revolving drum previously charged with a mixture of concentrated bleaching liquor and water, the proportions being such that no subsequent draining of the bleached mass is necessary.—J. F. B.

Beating engines for paper making and the like. R. Marx, London. Eng. Pat. 9049, April 17, 1913.

An engine of the Hollander type has a trough with parallel sides and semicircular ends, a wide midfeather with side and end walls parallel to the side and end walls of the trough, and a floor sloping downwards and outwards from the back-fall to a point near the front rise, whilst its inclination to the vertical wall of the midfeather gradually decreases. The pressure of the roll is counterbalanced by levers and sliding weights.—J. F. B.

Paper pulp ; Treatment of ——. [*Beating engine.*] R. Marx, London. Eng. Pat. 10,353, May 2, 1913.

In a beating engine two rolls are provided, one on each side of the midfeather, the rolls being driven independently and capable of separate adjustment as to pressure. The cross-section of the trough is narrowed about the ends of the midfeather but widens out in front of each roll. One roll may be built up of basalt lava or equivalent material, the other being furnished with ordinary beating bars. —J. F. B.

Process for the clarification of effluents. Ger. Pat. 266,998. *See* XIXb.

Preparing aseptically-sterile thread and bandages. Ger. Pat. 266,953. *See* XX.

VI.—BLEACHING ; DYEING ; PRINTING ; FINISHING.

Dyeing cotton with basic dyestuffs ; Composition of the lake produced in ——. A. Sanin. Kolloid-Zeits., 1913, **5**, 305—310.

The author has shown previously (this J., 1911, 533) that basic dyestuffs and tannin form definite chemical compounds if excess of the dyestuff be used, and adsorption compounds in presence of excess of tannin. The same is true in the case of the interaction of tannin and tartar emetic, a compound $(C_{14}H_9O_9)_2SbOH$, being formed in cold dilute solutions if excess of tannin be avoided. In dyeing cotton with basic dyes the necessary conditions for the formation of definite compounds are present, and experiments with Chrysoidine, Magenta, Crystal Violet, Safranine, and Victoria Blue showed that compounds are formed, 1 mol. of the dyestuff (chloride) combining with 1 mol. of the antimony-tannin compound, with elimination of hydrochloric acid.—A. S.

Patents.

Per compounds ; Process for washing and bleaching with alkaline solutions of ——. Chem. Werke vorm. H. Byk, F. L. Schmidt and R. Grüter, Berlin. Eng. Pat. 9247, April 19, 1913.

The addition of small quantities of a compound of tin or titanium to solutions of per-salts, such as sodium perborate, employed for washing and bleaching, renders the solution more stable on heating. For instance, a solution of 0·2 part of sodium perborate in 200 c.c. to which is added 0·01 part of $SnCl_4,3H_2O$ or 0·02 part of $Ti(SO_4)_2$, may be heated at 80°—85° C. for over 30 minutes with very slight loss of active oxygen.—J. F. B.

Dyeing machines. J. Farrar, Halifax, and A. R. Whitehead, Leeds. Eng. Pat. 28,245, Dec. 7, 1912.

In dye vats of the type in which the vat is divided into a circulating chamber and a compartment for the material (yarn), a pipe is fitted which communicates from outside the vat with a point in the circulating chamber near the circulating paddles, and which serves for the addition of dye liquor to the vat in such a way that the freshly added dye liquor is rapidly mixed with the liquor already in the vat.—J.B.

Dyeing with dyestuffs insoluble in water or water-insoluble leuco compounds of dyestuffs ; Process for ——. R. Wedekind und Co. m. b. H., and M. Iljinsky, Uerdingen, Germany. Eng. Pat. 27,391, Nov. 28, 1912.

See Fr. Pat. 451.533 of 1912 ; this J., 1913, 598.—T. F. B.

Yarn hanks and the like , Apparatus for treating —— *with liquids.* B. Teufer and L. Hermsdorf, Chemnitz, Saxony. Eng. Pat. 12,834, June 2, 1913.

See Fr. Pat. 458,047 of 1913 ; this J., 1913, 1007.—T. F. B.

Fabrics ; Process of producing patterns on ——. M. Freiberger, Budapest, Austria-Hungary. U.S. Pat. 1,080,433, Dec. 2, 1913.

See Eng. Pat. 13,896 of 1908 ; this J., 1909, 472.—T. F. B.

Fabrics and the like ; Process for waterproofing ——. H. and G. T. Oliver. Fr. Pat. 460,226, July 10, 1913.

See Eng. Pat. 21,697 of 1912 ; this J., 1913, 941.—T. F. B.

VII.—ACIDS ; ALKALIS ; SALTS ; NON-METALLIC ELEMENTS.

Chromic acid ; Neutralisation of ——. L. Margaillan. Comptes rend., 1913, **157**, 994—995.

The progressive neutralisation of chromic acid by sodium hydroxide was followed by the electrometer method, using an electrode of platinum saturated with hydrogen. The E.M.F. curve was interrupted by two almost vertical portions (instead of one, as with sulphuric acid), corresponding respectively to the addition of one and of two equivalents of alkali.—F. Sodn.

Selenious acid; Colourimetric determination of traces of ——. J. Meyer and W. von Garn. Z. anal. Chem., 1913, **53**, 29—33. (See also this J., 1913, 825.)

Selenious acid liberates iodine from acidified potassium iodide solution, the colloidal selenium which separates intensifying the colour: $H_2SeO_3+4HI=2I_2+3H_2O+Se$. Five c.c. of the solution to be tested, and 5 c.c. of a standard solution, respectively, are placed in 100 c.c. graduated cylinders provided with a stopcock near the bottom. 70 c.c. of purest distilled water, one drop of a protective colloid (*e.g.*, gum arabic) and 5 c.c. of 5 per cent. hydrochloric acid are then added to each cylinder, and after careful mixing, the volume is made up to 99 c.c. One c.c. of 50 per cent. potassium iodide solution is stirred in and after 5 minutes the colours are matched by withdrawing a suitable quantity of liquid from the cylinder in which the colour is strongest. Selenious acid can be determined by this method in solutions containing one part in 1,000,000. —W. R. S.

Thiosulphates; Volumetric determination of —— in presence of sulphites. J. Bodnàr. Z. anal. Chem., 1913, **53**, 37—41.

When silver nitrate is added to a solution containing thiosulphate, the silver thiosulphate first formed changes into sulphide: $Ag_2S_2O_3+H_2O=H_2SO_4+Ag_2S$, one half of the sulphur of the thiosulphate being converted into sulphuric acid. This reaction takes place on standing some time cold, any sulphite present gives silver sulphite which is only decomposed on boiling. 5—10 c.c. (*i.e.*, an excess) of 2 per cent. silver nitrate solution is diluted with 60—70 c.c. of water in a 100 c.c. flask, and the solution to be examined is added under constant agitation. The flask is shaken until the black precipitate has gathered and the liquid is perfectly clear. The volume is then made up and the excess of silver precipitated in 50 c.c. of the filtrate with sodium chloride; the titration is done with $N/20$ alkali and methyl orange. The process may also be used for standardising sodium thiosulphate; chlorides do not interfere.—W. R. S.

Iodides; Iodometric determination of ——. E. Müller and G. Wegelin. Z. anal. Chem., 1913, **53**, 20—28.

The distillation of the iodine liberated from iodides by the action of oxidising agents, such as potassium iodate and sulphuric acid, can be avoided by operating as follows: The solution contained in a stoppered flask is treated with 10 c.c. of 10 per cent. sulphuric acid, sufficient benzene to dissolve the iodine, and an excess of potassium iodate solution. The flask is well shaken, after which a solution of 4 grms. of dehydrated borax is added to neutralise the sulphuric acid. After renewed shaking, 3 grms. of potassium iodide crystals are added, and the solution is titrated under constant agitation with $N/10$ solution of arsenious acid (not thiosulphate), proceeding slowly towards the end.—W. R. S.

Phosphates and silicates; Action of phosgene on natural ——. J. Barlot and E. Chauvenet. Comptes rend., 1913, **157**, 1153—1155.

In continuation of previous work (this J., 1911, 127, 694), the action of phosgene on phosphate and silicate minerals was studied. Vivianite and pyromorphite were attacked at 350° C., and at 500° C. the iron and lead were converted almost instantaneously into chlorides: $3MO,P_2O_5+6COCl_2=2POCl_3+6CO_2+3MCl_2$. Uranite was decomposed very rapidly at 800° C., uranic chloride (volatile) and calcium chloride being formed. Of natural silicates, thorite, gadolinite, and cerite were attacked at about 1000° C. and very rapidly at 1150° C., the chlorides formed being condensed in the cooler parts of the apparatus. Zircon was not attacked until 1250° C. was reached, when the iron volatilised as chloride. On subsequently heating to 1300° C. in a current of phosgene, chlorination proceeded rapidly; the condensed zirconium chloride was contaminated by traces of calcium and magnesium chlorides, but was obtained pure by re-distilling at 500° C. Emerald was not attacked at temperatures up to 1400° C. The action of phosgene at high temperatures was found specially useful for the determination of thorium in monazite and for the preparation of anhydrous chlorides, *e.g.*, uranic chloride from uranite.—A. S.

Alkaline earth metals; New compounds of nitrogen and hydrogen with ——. F. W. Dafert and R. Miklauz. Monatsh. Chem., 1913, **34**, 1685—1712.

By the action of nitrogen or of hydrogen on the pure metals obtained by the method of Guntz (this J., 1910, 1389) the pure nitrides or hydrides were obtained. All the nitrides would react with hydrogen to form compounds of the formula $M''_3N_2H_4$, and such compounds were actually isolated in the cases of calcium and strontium. The barium compound however reacted readily with hydrogen at a comparatively low temperature to give barium hydride and nitrogen. An appreciable quantity of ammonia was also evolved, and as the resulting barium hydride could be converted into nitride by heating in nitrogen, the method might perhaps be used for the synthesis of ammonia. All the metals, hydrides, and nitrides, when heated in a mixture of nitrogen and hydrogen, and the hydrides when heated in pure nitrogen, yielded imides ($M''NH$), which became dark coloured on exposure to light, probably owing to the reaction $4M''NH=M''(NH_2)_2+M''_3N_2$. Imide formation was most prominent in the case of calcium and least so in the case of barium. None of the imides were, however, obtained quite pure. The following tables give the temperatures at which the metals and their nitrides begin to react with nitrogen and hydrogen respectively:—

Metal.	Nitrogen.	Hydrogen.	Nitrides.	Hydrogen
	°C.	°C.		°C.
Calcium ..	410	300	Calcium	230
Strontium	380	215	Strontium ..	270
Barium ..	260	170	Barium	300

—W. H. P.

Nitric oxide; Decomposition of —— at high pressures. E. Briner and N. Boubnoff. J. Chim. Phys., 1913, **11**, 597—631.

Nitric oxide when highly compressed undergoes decomposition in two ways according to the equations: $2NO=N_2+O_2$ and $4NO=2N_2O+O_2$, the second action predominating particularly at low temperatures. The oxygen formed unites with the excess of nitric oxide forming nitrous anhydride and nitrogen peroxide. The reaction velocity is proportional to the concentration (*i.e.*, to the pressure) at a constant temperature, and since the observed velocities agree with the concentrations from 50 to 400 atmospheres, it is justifiable to assume that the decomposition takes place although with extreme slowness at atmospheric pressure.—W. H. P.

Hydrogen peroxide; Preservation of —— by means of acetanilide. A. M. Clover. Amer. J. Pharm., 1913, **85**, 538—545.

The addition of 0·05 per cent. of acetanilide to hydrogen peroxide solution increases the stability to such an extent that only about 2·7 per cent. is decomposed in 5 months. The presence of mineral acids and of salts of the alkalis and alkaline-earths has no influence on the stability of the peroxide solution; traces of copper and iron increase the rate of decomposition.—W. P. S.

Ytterbium; Decomposition of —— into its elements. C. Auer von Welsbach. Monatsh. Chem., 1913, **34**, 1713—1728.

By fractionation of ytterbium the author isolated and purified the compounds of two constituent elements, cassiopeium Cp (At. wt. 175·00) and aldebaranium Ad

(At. wt. 173·00). From the original 500 grms. of ytterbium oxide about 48 grms. of cassiopeium oxide and over 200 grms. of aldebaranium oxide were obtained.
—W. H. P.

Radio-elements; Behaviour of —— in precipitation reactions. K. Fajans and P. Beer. Ber., 1913, **46**, 3486—3497.

It has been shown previously (compare Soddy, this J., 1911, 84) that radioelements which occupy the same place in the periodic system as ordinary elements are chemically identical with such elements and cannot be separated therefrom by any method of fractionation. Experiments with radium E and other radioelements have now led to the general rule that a radioelement will be precipitated in all cases where the chief element of its pleiade (the ordinary element occupying the same place in the periodic system) would be precipitated if present in weighable quantities. For example, radium E, belonging to the bismuth pleiade, is precipitated in all cases where bismuth (in greater concentrations) would be precipitated. Since it has been found that abnormal adsorption phenomena occur much less frequently than would be expected in these precipitation reactions of radio-elements, the general rule given affords a useful means of ascertaining the chemical nature of radio-elements. Experiments with radium A have shown that this is identical chemically with polonium and of the ordinary elements most resembles tellurium, not mercury, as has been supposed by Russell and by von Hevesy. In a solution containing univalent and divalent mercury, together with bismuth, if the latter be precipitated as phosphate in strongly acid solution, it carries down radium A quantitatively, thus separating it from mercury.—A. S.

Radioactive substances; Colloidal solutions of ——. II. F. Paneth. Kolloid-Zeits., 1913, **13**, 297—305. (See also this J., 1913, 789.)

In acid solution all the radioelements examined dialysed with normal velocity, but in neutral solution, polonium and radium E, and in ammoniacal solution, also thorium B dialysed very much more slowly. In acid solution polonium and thorium B travelled almost exclusively to the cathode and in ammoniacal solution to the anode; radium and thorium X travelled to the cathode in both acid and ammoniacal solutions. The particles which travelled to the anode were retained by parchment to a much greater extent than those which travelled to the cathode. The colloidal particles of polonium and radium E in neutral solutions and of thorium B and radium D in ammoniacal solutions must be extraordinarily small, for acid, neutral, and ammoniacal solutions all appeared alike when examined ultramicroscopically.—A. S.

Phosphorus; Modifications of ——. A. Stock and E. Stamm. Ber., 1913, **46**, 3497—3513.

Phosphorus vapour when superheated and then cooled rapidly, condensed partly as red phosphorus (see this J., 1912, 685). Experiments at different temperatures and pressures designed to ascertain some relation between the degree of dissociation of the phosphorus vapour and the quantity of red phosphorus deposited gave inconclusive results quantitatively, but qualitatively the process appeared to comprise first dissociation: $P_4 \rightleftarrows P_2$, and then union of P_4 and P_2 mols. to form mols. of red phosphorus: $xP_2 + yP_4 = P_{2x+4y}$. Red phosphorus exists in the form of vapour, for when heated, with exclusion of light, to 280°—400° C., it distilled and the condensed product in the cooler part of the tube always consisted to a small extent of the red modification; Hittorf's crystalline phosphorus yielded colourless distillates at 300°—350° C. and also when the vapour was heated to 500° C. Contrary to Arctowski's statement (Z. anorg. Chem., 1896, 12, 225), red phosphorus when free from white phosphorus and heated in a vacuum (*i.e.*, with exclusion of air and moisture) was not perceptibly volatile at 100° C. or even at 200° C. The description of Hittorf's phosphorus as "metallic phosphorus" is quite erroneous: the pure product was practically a non-conductor of electricity (See also Wahl, this J., 1913, 288.)—A. S.

Patents.

Sulphuric anhydride; Manufacture of —— by the contact process. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 460,074, July 5, 1913. Under Int. Conv., July 13, 1912.

Compounds of silver and vanadium are employed as catalysts. For example asbestos is impregnated with ammonium metavanadate, then treated with silver nitrate, and washed. Using asbestos containing 20 per cent. of silver vanadate, the sulphur dioxide present in burner gases is, it is stated, converted almost quantitatively into sulphur trioxide at about 520° C.—A. S.

Ammonia [from nitrogen]; Production of ——. R. W. Wallace and E. Wassmer, London. Eng Pat. 18,450, Aug. 10, 1912.

Magnesium or other suitable metal is converted into nitride, and this is divided into two portions, one of which is treated with hydrogen sulphide to form sulphide and ammonium sulphide, and the other with hydrochloric acid to form chloride; the sulphide and chloride are then electrolysed together and the metal obtained again converted into nitride, and so on, the sulphur and chlorine and/or chlorides of sulphur also produced by electrolysis being treated to form hydrogen sulphide and hydrochloric acid. Chloride may, if desired, be introduced from an outside source and only part of the metal converted into nitride.—F. Sodn.

Hydrogen and ammonia: Manufacture of ——. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 26,770, Nov. 21, 1912.

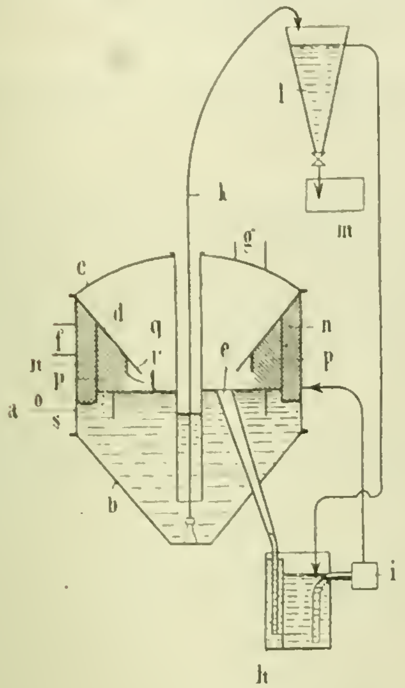
Carbon monoxide and steam are caused to interact at 300°—600° C. under a pressure of 4—40 atmospheres in the presence of a catalyst, such as iron, nickel, or the like, with the production of carbon dioxide and hydrogen, the former being removed by absorption, and the compressed hydrogen being ready for the synthetic production of ammonia under pressure.—O. R.

Chlorides of the alkali metals; Treatment of —— for the obtainment of useful products therefrom. J. A. Kendall, London. Eng. Pat. 26,896, Nov. 22, 1912.

An alkali chloride is heated to about 1100° C. in a nickel or cobalt vessel in the presence of steam and finely divided molybdenum or tungsten. Hydrogen and hydrochloric acid are evolved, and the alkali molybdate or tungstate also formed is reduced in a second stage of the process by means of carbon at 1200°—1300° C. The products of the second stage are alkali metal vapour, carbon monoxide, and metallic molybdenum or tungsten, the latter being then used to treat a fresh charge of alkali chloride. The alkali metal vapour may be condensed, oxidised in the presence of carbon monoxide to form alkali carbonate, or used for the production of cyanides.
—O. R.

Ammonium sulphate; Saturator for the recovery of ——. C. Otto und Co. Ges. m. b. H. Fr. Pat. 459,219, June 13, 1913.

A cylindrical saturator, *a*, with a truncated, conical bottom, *b*, and a dome-shaped cover, *c*, is provided with an overflow, *e*, and an ejector, *k*, which transfers the deposited ammonium sulphate to the funnel-shaped vessel, *l*. The mother liquor escaping from the overflow, *c*, and from the vessel, *l*, runs into a receptacle, *h*, from which a pump, *i*, returns it to the saturator. As soon as the vessel, *l*, is full of wet salt, the latter is introduced into a hydro-extractor, *m*, and centrifuged. Two concentric cylinders divide the saturator into annular compartments, *n*, and *p*, these being bounded at the top by the truncated cone, *d*. The gases enter at *f*, pass below the level of the liquor at *o*, and are deflected upwards by the baffle cylinder, *s*, which also serves to prevent undue agitation of the liquor near the overflow. Passing upwards into the space, *p*, the gases are freed from adhering liquid by the walls, *d* and *t*, and finally impinge horizontally against the central, vertical tube, and so out of the apparatus through *g*. The velocity of the issuing gases is so small that any traces of accompanying mother liquor fall back from *g* into the saturator.—O. R



Electrolysis of halogen alkalis; Process and apparatus for the —— Siemens und Halske A.-G., Berlin. Eng. Pat. 18,102, Aug. 8, 1913. Under Int. Conv., Feb. 20, 1913.

In the electrolysis of alkali halides in apparatus on the "horizontal diaphragm principle," a valve is arranged in the outlet passage of the cathode space, and the hydrogen is maintained under slight pressure, which is almost sufficient to counteract the hydrostatic pressure of the electrolyte above the diaphragm. The speed of filtration is thus regulated and made to correspond with the electric current used, the process allowing of the employment of a very thin filtering medium, such as asbestos fabric.
—O. R.

Ferrocyanides; Production of ——. [*Recovery of hydrogen cyanide from retort gases.*] W. H. Coleman. Eng. Pat. 27,908, Dec. 4, 1912.

Coke-oven or other gases containing hydrocyanic acid are passed through a tower packed with lumps of Cleveland iron ore or other native ferrous compound, through which circulates a solution of sodium carbonate or other suitable alkaline solution or suspension, and the resulting alkali or alkaline-earth ferrocyanide liquor is treated for the recovery of ferrocyanides.—F. Sodn.

Cyanides; Impts. in the process of Marguerille and Sourdeval for the manufacture of ——. F. Gros, P. Goissedet, F. Bouchardy, and M. Fossier. Fr. Pat. 460,684, July 23, 1913.

A mixture of 8 parts of barium carbonate, 3 of carbon (petroleum coke or anthracite), and 2 of tar is moulded into balls and these are heated to 600° C. in gas retorts to recover the tar by distillation. The balls are then placed in an electric furnace heated to 1600° C., and subjected to the action of a gas containing nitrogen, *e.g.*, producer gas or air, whereby barium cyanide is produced. The furnace is an inclined cylinder; at the ends of the middle reaction zone are two rings of carbon electrodes, with intermediate electrodes for use at the beginning of the heating; the charge itself serves to conduct the current when it becomes hot. The cyanide may be subsequently decomposed by steam, with the evolution of ammonia and carbon monoxide and formation of baryta for use again in the process.
—A. S.

Aluminium-bearing materials; Treatment of —— [*for the manufacture of aluminium hydroxide*]. H. P. Bassett, Catonsville, Md. U.S. Pat. 1,079,589, Nov. 25, 1913.

Clay, felspar, slate, or the like, 5 parts, sodium carbonate, 3 parts, and sodium sulphate, 2 parts, are heated together, the product is carbonated, and the soluble portion of the product is carbonated, and the precipitated aluminium hydroxide is recovered.—O. R.

Alumina; Purifying ——. (1) H. F. Chappell, New York. (2) G. E. Cohen, Brooklyn, N.Y., Assignor to H. F. Chappell, New York. U.S. Pats. 1,079,899 and 1,079,900, Nov. 25, 1913.

(1) Alumina is freed from accompanying silica by first heating it to a temperature which renders alumina insoluble in hydrofluoric acid, then subjecting it to the action of hydrofluoric acid and water, and finally heating above 600° C. (2) Alumina is heated to a temperature which renders it insoluble in ammonium bifluoride, this reagent being then used to free the alumina from accompanying silica.—O. R.

Nitrous vapours; Absorption of —— by lime. A.T. Schloesing. Fr. Pat. 460,328, Oct. 2, 1912.

The nitrous vapours present in hot gases coming from an electric furnace are absorbed by means of quicklime at 300°—400° C., the quicklime being produced by burning limestone, either in fragments or in agglomerates, by means of the hot gases containing the nitrous vapours.
—A. S.

Sulphate furnaces; Scrapers for agitators in ——. Farbwerke vorm. Meister, Lucius, und Brüning. Fr. Pat. 460,484, July 17, 1913. Under Int. Conv., Feb. 14, 1913.

Claim is made for the use of scrapers of refractory, acid-resistant stone. In the example shown, the scrapers are pieces of stone of chisel-shape, fixed in supports by means of wedges and attached to the arms of the agitator by means of bolts.—A. S.

Sulphur dichloride; Manufacture of ——. Verein Chemischer Fabriken in Mannheim. Fr. Pat. 460,555, July 21, 1913. Under Int. Conv., July 30, 1912.

Sulphur dichloride is prepared by the action of chlorine on sulphur, sulphur monochloride, or other sulphur compounds, at the ordinary temperature, in presence of a catalyst, especially iron filings. Other substances which may be used as catalysts are cobalt, nickel, aluminium, manganese dioxide, anhydrous calcium chloride, and iron chloride.—A. S.

Thorium: Separation of —— from other rare earths. O. Knöfler und Co. Ger. Pat. 266,459, July 3, 1912.

Acid solutions of the rare earths, especially such as are obtained in the working up of monazite, are treated with sebacic acid, whereby thorium is precipitated. (See also this J., 1912, 361.)—A. S.

Per-salts ; Manufacture of ——. Chem. Werke vorm. Dr. H. Byk. Ger. Pat. 266,517, June 24, 1911. Addition to Ger. Pat. 248,683.

The preparation of, for instance, calcium perborate by the interaction of sodium perborate and a calcium salt, as described in the chief patent (see U.S. Pat. 999,497; this J., 1911, 1057) is carried out in presence of such a quantity of hydrogen peroxide that the concentration of the latter remains above 10 per cent. The sodium perborate is preferably dissolved in concentrated hydrogen peroxide, which precipitates the small quantities of compounds of heavy metals always present and which have a prejudicial effect on the stability of the per-salts. After filtering, the solution is treated with a solution of a calcium salt. The hydrogen peroxide prevents appreciable hydrolysis of the precipitated calcium perborate.—A. S.

Potassium carbonate ; Manufacture of —— by the interaction of potassium sulphate and sodium carbonate. Heldburg, A.-G. für Bergbau, bergbauliche und andere industrielle Erzeugnisse. Ger. Pat. 266,786, Jan. 11, 1913.

Potassium sulphate is treated, in aqueous solution, with a large excess of sodium carbonate, at 35°—40° C., whereby there are obtained a solution of potassium carbonate and a double potassium-sodium sulphate, of approximately the composition, $Na_2SO_4,2K_2SO_4$.—A. S.

Gases [oxygen] from solids ; Apparatus for obtaining ——. C. Weston, London. Eng. Pat. 25,326, Nov. 5, 1912.

The apparatus is a modification of that described in Eng. Pat. 15,000 of 1908 (this J., 1909, 884). The retort is provided with cylindrical inlet and discharge throats through each of which passes a rotary stopper of screw or disc form, mounted on an axial shaft ; the material itself forms a seal while being moved into or from the retort. A perforated plate beneath the upper cover serves as a secondary seal, and arms are provided for sweeping the material through the perforations into the body of the retort, in which is a number of distributing arms, superposed spirally. The material is discharged from the retort on to an adjustable platform, which may be hollow for heating or cooling purposes, and passes between crushing rolls, contained in a casing, to an open trough and elevator, thence to a rotary sorting table, and again into the retort if desired. Steam is supplied through nozzles at the base of the retort and gas withdrawn above by a pipe terminating internally in an upward bend covered by a cap. The retort is heated by a spiral surrounding flue connected with the boiler furnace.—F. Sodn.

Hydrogen and oxygen ; Production of —— by electrolytic processes. The Knowles Oxygen Co., Ltd., and R. W. Grant, Wolverhampton. Eng. Pat. 1812, Jan., 22 1913.

The electrolyte is made to undergo a preliminary electrolytic purification, generally with a current of low density, before passing to the cells for the production of oxygen and hydrogen. For this purpose, it may be passed at a suitable rate through a tank having a number of vertical baffle-plates functioning as weirs, of diminishing height towards the outlet ; these serve as positive electrodes, and corresponding suspended plates between them act as negative electrodes. After the preliminary treatment, the electrolyte passes preferably to settling tanks.—F. Sodn.

Hydrogen from water-gas or other gas containing carbon monoxide ; Process for the production of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 459,918, July 2, 1913. Under Int. Conv., July 23 and 24, 1912, Feb. 14 and 10, 1913.

The gas is passed, with an excess of steam, over heated finely divided metals of the iron group, especially iron, cobalt, and nickel, or their oxides, and the carbon dioxide formed is eliminated from the gaseous reaction product. The catalyst is best prepared by the addition of appropriate diluents or binding agents, organic or inorganic, which may be such as to give off gas on heating so as to increase the porosity. For example, dry precipitated ferrous carbonate may be made into a plastic mass with lime, water, potassium hydroxide, and ferric nitrate, and the mixture dried and heated to 500° C. A reaction temperature of preferably not over 600° C. is maintained by adjusting the temperature of the gases before they enter the contact chamber.—F. Sodn.

Iodine from caliche ; Recovery of —— and the prevention of corrosion of plant during concentration of caliche. H. L. Sulman, H. F. K. Picard, and Salts Extraction Syndicate, Ltd., London. Eng. Pat. 26,056, Nov. 13, 1912.

Loss of iodine and the corrosion of vats, etc., during the concentration of caliche liquors is prevented by treating these, preferably kept slightly alkaline, with sodium thiosulphate solution or other reducing agent capable of reducing iodates to iodides, and by adding a small quantity of neutral oil or hydrocarbon oil so as to form a surface film. The vessel may also be connected with the negative pole of an electric circuit, of which the positive pole is connected with an anode inserted in the liquid ; a feeble current efficiently protects the cathode surface.—F. Sodn.

Ammonium nitrate ; Process of making —— by the ammonia-soda process. F. A. Freeth, Great Crosby, and H. E. Cocksedge, London. U.S. Pat. 1,081,107, Dec. 9, 1913.

See Eng. Pat. 16,455 of 1910 ; this J., 1911, 1013.—T. F. B.

Ammonia-soda ; Process for making ——. A. Clemm. Fr. Pat. 460,837, July 28, 1913. Under Int. Conv., Dec. 3, 1912.

See Eng. Pat. 16,470 of 1913 ; this J., 1913, 1066.—T. F. B.

Perborates ; Process for the electrolytic manufacture of ——. K. Arndt, Charlottenburg, Assignor to Chem. Fabr. Grünau, Landshoff und Meyer A.-G., Grünau, Germany. U.S. Pat. 1,081,191, Dec. 9, 1913.

See Eng. Pat. 12,536 of 1913 ; this J., 1913, 910.—T. F. B.

Metallic oxides ; Process for the production of light voluminous —— specially suitable for catalytic reactions. F. Bedford, Sleaford, and E. Erdmann, Halle, Germany. Eng. Pat. 27,718, Dec. 2, 1912. Under Int. Conv., Dec. 18, 1911.

See Fr. Pat. 451,155 of 1912 ; this J., 1913, 602.—T. F. B.

Nitrogen oxides ; Apparatus for the preparation of ——. J. S. Island. Fr. Pat. 460,557, July 21, 1913.

See Eng. Pat. 11,363 of 1912 ; this J., 1913, 909.—T. F. B.

Hydrogen ; Manufacture of ——. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen on Rhine, Germany. Eng. Pat. 27,955, Dec. 4, 1912.

See Fr. Pat. 459,918 of 1913 ; preceding.—T. F. B.

Hydrogen and oxygen from water ; Apparatus for industrially producing —— by electrolysis. Soc. Anon. l'Oxhydrique Française, Paris. Eng. Pat. 18,818, Aug. 19, 1913. Under Int. Conv., Sept. 21, 1912.

See Fr. Pat. 459,967 of 1912 ; this J., 1913, 1156.—T. F. B.

Graphite from worn-out crucibles ; Method of recovering ——. A. Teichmann, Zeitz, Germany. U.S. Pat. 1,080,085, Dec. 2, 1913.

See Ger. Pat. 263,653 of 1912 ; this J., 1913, 1068.—T. F. B.

VIII.—GLASS ; CERAMICS.

Clays [; Classification of ——]. A. Müntz and H. Gaudechon. Comptes rend., 1913, **157**, 968—974.

Suspensions of clays of known concentration were allowed to settle in cylinders of 1 litre capacity, under identical conditions, for varying periods, and the proportion of suspended matter disappearing per hour from the uppermost 250 c.c., determined. Clays from different sources (prepared by Schloesing's method) varied considerably as regards their relative content of particles of any given dimension, the rate of deposition diminishing with time in a characteristic but often irregular manner, and comparative experiments carried out in an electric field led to similar conclusions, although in this case it was the smallest particles which were the most rapidly deposited. It is suggested that fractional deposition, under arbitrary conditions, might form a basis for the classification of clays.—F. Sodn.

Porcelain ; Soft artificial, frit or French ——. A. Granger. Bull. Soc. d'Encour., 1913, 120, 195—247.

A history of the origin and development of the various forms of porcelain, with special regard to those of France and of Sèvres.

Modern soft porcelain, dates from 1879, when Lauth found by analysis that the composition of the ware varied considerably with the firing temperature, owing to volatilisation of alkalis. It was decided to use a more acid frit, and Stas glass which has the composition : SiO_2 77, CaO 10·3, K_2O 7·7, Na_2O 5·05 per cent., was employed, while the marl was replaced by a mixture of chalk and Dreux clay. The figures for the body mixing were : sand 49, Stas glass 27·5, chalk 16·66, Dreux clay 6·86. The chemical composition was : SiO_2 80·31, Al_2O_3 2·62, CaO 13·27, R_2O 3·8 ; which meant that nearly 5 per cent. more silica was introduced at the expense of the lime and alkalis. More recent mixings, used for ware exhibited at the 1900 Exposition, are :—Sand 33, Stas glass 46, chalk 14, Dreux clay 7 ; with a glaze formula : 0·46 Na_2O, 0·54 PbO, 2·5 SiO_2. The ware is fired at cone 4 instead of at cone 7, like Lauth's mixing. Still more recently, kaolin has been substituted for Dreux clay, but the composition is not published. This new ware is called soft kaolin porcelain.
—H. H. S.

Patents.

Glass carboys ; Manufacture of ——. A. Schiller, Berlin-Schöneberg, Germany. Eng. Pat. 13,827, June 14, 1913.

An upper, two intermediate, and a finishing mould are successively used for mechanically blowing glass carboys. The walls of the finishing mould form the natural extension of the outline of the upper mould, and the two intermediate moulds can be raised into position from below, one being slightly wider than the other. The strong lateral projection of the carboy next to the neck is thus formed in the preliminary moulds in the early stages of blowing, and the vessel receives its final shape in the finishing mould without acquiring a " waist."—O. R.

Ceramic products moulded under great pressure ; Process of treating and moistening clays allowing the omission of drying of ——. G. Hidoux and J. Bernheim. Fr. Pat. 460,803, July 28, 1913.

A process of semi-dry moulding of clays and other more or less plastic materials, which consists in preparing these materials by disintegration, artificial drying, grinding and sifting and then moistening them by means of a spray of water so as to prevent the formation of moist lumps. The moistening apparatus consists essentially of a tray turning horizontally on its axis so that a layer of the material is passed under the orifices of the sprinkler and then through juxtaposed ploughs, which ensure mixing of the material without any compression or agglomeration ; the ploughs are preferably arranged in several rows so that the blades of one are zig-zagged with those of the preceding. The clay is moistened with water atomised by compressed air. Clay for the manufacture of bricks, tiles, etc., is thus obtained, containing from 8 to 11 per cent. of water, in a pulverulent condition and free from moist lumps, so that the products obtained by compression of the powder in closed moulds can be immediately transferred to the kiln without intermediate drying.—W. C. H.

Enamelling ; Process and firing oven more especially applicable to ——. O. Zahn. Fr. Pat. 460,104, July 7, 1913. Under Int. Conv., Sept. 25 and Oct. 10, 1912, and Feb. 26, 1913.

To suppress heat at certain points where it would be injurious to enamelled objects fired in a muffle oven, the excess heat may be absorbed by accumulating material or by special cooling devices at these points, or the heat which surrounds the muffle may be prevented from acting on the cover, or part of the muffle—specially the cover—may be treated differently with regard to local heating. These objects are attained by prolonging the side walls of the muffle up to the arch of the heating chamber, by shielding the cover of the muffle with an insulating material to prevent radiation of heat towards the interior ; by diminishing the radiation from the hot gases through the side walls towards the upper part of the muffle by means of insulating or other material or by curving the walls outwards ; by the provision of a cooling conduit, or a space connected with a cooling chamber by suitable valves, above the muffle ; and by applying heat only at certain points and not uniformly over the component parts of the oven.—W. C. H.

IX.—BUILDING MATERIALS.

Portland cement ; Influence of sodium bisulphite on ——. H. Luftschitz. Tonind.-Zeit., 1913, 37, 1986—1987.

Tests on mortar made from [German] standard sand and Portland cement to which sodium bisulphite had been added gave the following mean results :—

Bisulphite, per cent.	Kilos. per sq. cm.					
	Tensile strength.			Compression strength.		
	Days.			Days.		
	7	28	28 (In air after 7)	7	28	28 (In air after 7)
—	26·2	29·8	36·6	210	295	352
0·5	21·6	29·4	41·2	186	239	286
1	17·0	24·9	36·6	128	188	235
2	17·4	20·0	26·0	83	124	152
4	18·6	21·1	18·1	109	133	154

Soluble calcium bisulphite is probably formed.—F. Sodn.

Portland cement clinker ; The constitution of ——. E. D. Campbell. Tonind.-Zeit., 1913, 37, 1907—1910.

A cylindrical disc of Portland cement clinker (about 30 mm. diam., 18 mm. thick), with plane polished surfaces was placed between two thin, similarly polished discs of pure, porous magnesia. Two larger magnesia discs (about 30 mm. diam., 3—4 mm. thick) were placed above and below the smaller discs respectively, and the whole combination, each section of which had been carefully weighed, was heated in a gas furnace to 1475°—1575° C. for from 2½ to 13 hours. The temperature, measured by means of a platinum-rhodium thermo-element, could be maintained constant within 10° C. At the range of temperatures in question Pierce had shown that the celite constituent of Portland cement clinker fused and was absorbed by magnesia, whilst the alite constituent remained solid and crystalline. The weight of the magnesia discs and their chemical composition after the treatment thus afforded means of determining the relative amounts and the approximate chemical composition of alite and celite. The experimental results indicated that celite is a calcium aluminate, which fuses at a little above 1400° C. and in the fluid condition dissolves calcium oxide and calcium orthosilicate, the former being the more soluble, and the two dissolving in fused celite in accordance with the same laws which hold good for saline solutions. Alite is composed mainly of α- or β-calcium orthosilicate with calcium oxide and a certain amount of calcium aluminates and ferrites in solid solution. The amount of calcium oxide in solid solution depends on the total amount of bases present in the mass and on the clinkering temperature, but the solution limit is probably reached when the ratio $CaO : SiO_2$ is that required for the formation of tricalcium silicate.—O. R.

Testing of cement. Precautions required. W. L. Gadd, Concrete Institute. "Times" Eng. Suppl. Dec. 17, 1913.

The author drew attention to fallacies in some of the recognised processes of testing Portland cement, especially in connection with the British standard specification.

Time of setting. The standard specification stipulated that before any sample of cement was submitted to certain tests it "should be spread out for a depth of 3 in. for 24 hours in a temperature of from 58° to 64° F." (14°—18° C.) The object appeared to be to cool the cement to the normal temperature, and to obtain conditions similar to those governing cement which had lain in sacks or casks for two or three weeks. Cooling could, however, be very simply done without exposing the sample to air, and aeration was apt to lead to unreliable results in subsequent setting-time tests. Cement kept in sacks, under ordinary conditions of dry storage, became either slower or quicker in setting, but the result could not be foretold.

The setting time was differently affected when the same cement was aerated or stored in bulk in different localities or at different periods. Pure, dried air had no effect upon the setting time of cement, but the effect of moist air free from carbonic anhydride was distinctly marked, while the acceleration of setting time by absorption of carbonic anhydride was proved.

Fineness. In regard to the British standard specification for the manufacture of wire cloth for sieves, many rolls of cloth which contained the stipulated number of threads, of practically the correct diameter, were hopelessly inaccurate for the purpose of testing cement for fineness. The size or area of the holes in a sieve was the real standard and should be stipulated, the actual diameter of the threads, or their precise number per inch, being of secondary importance. Another point which appeared to be overlooked was the size of the sieve itself. A very finely ground sample gave 3·5 per cent. of residue on a large sieve and 5·6 per cent. on a smaller one—a difference of 37 per cent. of the total.

Specific gravity.—The specific gravity test was still retained in the British standard specification, and was considered to fulfil the functions formerly attached to the bushel weight test—viz., to detect the degree of burning to which the clinker had been subjected. The author agreed with the conclusions reached by Butler that the specific gravity of cement was no indication whatever of proper calcination, but depended upon the age of the cement and the opportunities it had had of absorbing water and carbonic anhydride from the air. In some specifications the specific gravity was directed to be taken after the cement had been dried at 1000° C., but this could have no effect, the lowest temperature for the expulsion of carbonic anhydride being 300° C. For certain doubtful cements the only reliable guide was a chemical analysis, and having this the specific gravity was superfluous.

Standard sand. There was a somewhat general idea that tensile or crushing tests of cement with standard sand represented the best results of which the cement was capable. This was erroneous. The use of standard sand merely gave results which were comparable. The standard sands specified in different countries and the results of a number of tests made with these were given in the paper, and from these it was shown that the crushing resistance of concrete made from the same cement varied not only with the size, but also with the character of the aggregate. Dealing with the autoclave test, the author said it was merely a revival of Erdmeyer's high pressure steam test introduced into Germany about 1881, and rejected by German cement experts as being unreliable and misleading. Quite recently the autoclave test had been subjected to critical examination both in the United States and in Canada, and the conclusions arrived at were that a case for its adoption had not been made out.

Free lime. No theory connected with Portland cement had obtained a stronger hold than the idea that unsoundness of cement was due to free lime locked up within the particles of the ground material. Well-authenticated facts were directly opposed to the theory that expansion of cement was caused by free lime. The author's view was that unsoundness in cement was probably due to the presence of an abnormal silicate, perhaps dicalcium silicate, an unstable compound, and slowly disintegrated with an increase in volume.

Road construction ; Part played by water in macadam ——. W. G. Fearnsides. Trans. Surveyors' Inst., 1913, **46**, 33—80.

Water is an essential constituent of all road constructions and, when present in excess, is most generally responsible for their automatic disintegration and decay. The road surface suffers more from mechanical abrasion by traffic, but the under layers are subject to continuous action by percolating or stagnant water. Roadstones consist largely of felspar, and the less silicious the felspar the more soluble does it prove. Any rock which contains ferrous iron will be "rusted" as well as partially dissolved, and lime when present in rocks will be converted into calcium carbonate. Sulphides are oxidised to sulphates with production of some free sulphuric acid. Solvent action is most destructive and rapid when calcium carbonate present as a cement holding other and less soluble mineral grains together is attacked. For this reason, cement stones from clay districts, calcareous grits, bastard limestones, Green-sand and even Kentish Rag make poor material for underlayers. Igneous rocks, if not partly weathered in the quarry, may be considered as immune for many years. The worst road-materials in common use are the slags, whether as surface or under layer. Turning from the solvent to the physical properties of water, its binding power is an effect of surface tension, and for maximum efficiency the proportion of water should be kept at the optimum. "Potholes" grow by the wear of traffic at those places where by local water-pockets the proportion of water is above the optimum. The road materials which, bound with water, are strongest are those which break into pieces with flat faces readily wetted by water, as for example Derbyshire limestone. Briquettes of crushed road-stone afford a convenient method of testing its binding power. Rocks which have the lowest silica percentage give, when briquetted, the greatest tensile and crushing strength. For use in dry climates, rocks whose strength attains a maximum with little water are suitable, while those which require more water are better fitted for the damp atmosphere and frequent showers of hilly districts. The importance of cambering and draining the site is equal to that of arranging the configuration of the road surface. The effects of dew, especially of dew which distils from below, and of hoar-frost, precipitation of rain and the humidity of the atmosphere, emphasise the need of complete sub-crust drainage. Amongst solids which it does not wet, water acts as an insulator, and must be rigorously eliminated in the making of tar, pitch, asphalt or bitumen macadam before stones and binder are brought together. Slag, otherwise a poor road material, acts well with these binders because, cooled from a state of fusion, it has no moist surface. The author suggests chemical drying by adding to partially dried stones a suitable proportion of quicklime or unslacked cement, in order that the tar or asphalt may make firm contact. In the subsequent discussion, some exception was taken to the author's depreciation of slags.—H. H. S.

Patents.

Bitumen macadam. J. J. Ingham, Bradford. Eng. Pat. 1459, March 18, 1913.

Three parts of tar, 1 part of Trinidad bitumen, and 1 part of "petrol pitch" (German pitch mixed with petrol) are boiled together for about two hours and poured on to 1:

parts of limestone or "steel slag." The mixture is turned over a number of times, allowed to stand for two days, and then turned over again, after which it is ready for application to road surfaces, being preferably put down in three separate layers and well rolled.—O. R.

Portland cement; Application of the waste from sugar-refineries to the manufacture of an artificial ——. Soc. Anon. des Etablissements A. Maguin. Fr. Pat. 460,438, Oct. 4, 1912.

The fine state of division of the precipitated calcium carbonate produced in sugar refining is specially favourable to the manufacture of cement. The waste material is forced into a settling tank and then carried by a screw conveyor to a battery of three mixers in which it is combined with the requisite quantity of clay, and from which a pump forces the slurry into an agitator. This slurry is diverted into a rotary kiln provided with a lining of refractory bricks at the coolest part and of cement clinker at the hottest part. The kiln is fired with a mixture of powdered coal and air under pressure; this coal is obtained by making it pass, after breaking, into a rotary drier and then into a grinding mill with two tubes from which it is caught by the elevators of the automatic stoker. —W. C. H.

Fibrous cement or artificial stones; Process for rendering plates of —— *(electrical) conductors.* A. Göpfert. Fr. Pat. 460,683, July 23, 1913. Under Int. Conv., Sept. 11, 1912.

Plates of fibrous cement, or artificial stones, which are to be covered with an electrolytic deposit, are rendered conducting by means of a conducting material deposited either in the paste of fibrous cement or artificial stone, or during the manufacture of the plates, or in the moulds, or on the finished but not hardened products, in such a way that when hardening takes place, the conducting material combines with the surface of the mass and perfect adhesion of the electrically deposited coating is ensured.—W. C. H.

Ligneous materials; Process of injection and re-agglomeration of ——, *and agglomerations of cork by resin "foam."* A. Blavinhac. Fr. Pat. 460,807, Oct. 14, 1912.

Cork, previously agglomerated by glue, is injected with a solution of resin the degree of fluidity of which is regulated so that it thoroughly penetrates all the cavities, flaws and holes in the cork, and leaves in the angular spaces between the granules sufficient resin to ensure agglomeration of neighbouring particles being secured in case the glue is removed by moisture. The agglomerates are not appreciably increased in weight or in conductivity by the treatment. The solvent of the resin is distilled off and recovered by heating the mass, and the resin left in the form of moss or scum, which conducts less than compact resin. The heating may be increased till incipient distillation or carbonisation of the cork occurs, which still further diminishes the heat conductivity. —W. C. H.

Viscous mass especially for the asphalt industry; Process for preparing a tough ——. J. Goepper and O. Geiger, Obertürkheim, Germany. Eng. Pat. 4896, Feb. 26, 1913.

Process for making a plastic rubber-like mass for tarring roads, etc. Fr. Pat. 460,943. *See* III.

X.—METALS; METALLURGY, INCLUDING ELECTRO-METALLURGY.

Explosives; Use of —— *for removing obstructions in the blast furnace.* H. Schöneweg. Z. ges. Schiess- und Sprengstoffw., 1913, **8**, 415—418.

Obstructions which entirely prevent the passage of the blast can be removed by firing a charge of about 600 grms. of dynamite in a tube, introduced through the wall of the furnace in the neighbourhood of the obstruction; 1—1¼ kilos. are sometimes necessary, and can be used without danger to the furnace if the charge is at least 400—500 mm. from the furnace wall. The tube containing the charge is introduced into a larger tube which has previously been introduced through a hole drilled in the furnace wall, and the charge is fired by a fuse. There should be free play between the two tubes.—A. T. L.

Cast-iron; The influence of carbon and silicon on the mechanical properties of gray ——. F. Wüst and K. Kettenbach. Ferrum, 1913, **11**, 51—54, 65—80.

Test bars prepared from Swedish iron and 75 per cent. ferrosilicon, and containing C 2 to 4 per cent., and Si 0·45 to 3·24 per cent., were examined micrographically and by mechanical tests, and show uniformity with other cast irons. The quantity and form of the graphite present are the determining factors of the mechanical properties. As influencing the form in which graphite separates, the manner of cooling is of importance, this in its turn being dependent on the method of pouring; the proportion of graphite separating, for a given carbon content and method of cooling, increases, as is well known, with the silicon content. Strength and hardness of iron decrease, in general, with increasing graphite. With increasing total carbon and silicon, the strength, in general, diminishes owing to the coarsening of the graphite. The form of graphite most favourable to the mechanical properties is "temper-carbon," occurring in "nests" of irregular shape, in contrast with lamellar-graphite, which breaks up the structure of the iron.—T. St.

Steel; The electric refining of —— *in an induction furnace of special type.* O. Frick. Iron and Steel Inst., Sept. 1913. [Advance proof.]

The author discusses the processes of steel melting and refining, with special reference to the Frick induction furnaces, from the chemical and commercial standpoints, from results obtained at Krupp's works in Essen. The normal frequency of the current employed in the Frick furnaces varies between 15 and 5 cycles for furnaces above 1 to 2 tons capacity, with voltages up to 5000 volts, and even higher for large furnaces. The lining consists of very pure magnesite without any binding agent, and is protected from the cutting action of the slag by introducing powdered magnesite to form a heap in front of the inner wall, against which it is pressed by the inclination and rotation of the bath. The lining has a life of two to three months as a rule. The inclination (5°) and rotation of the bath are sufficient to secure all possible advantages, and are at the same time small enough to obviate the necessity of having too much slag to cover the bath. Special attention is given to keeping down the radiation losses, which are of the greatest importance in electric furnaces. Results obtained from actual working of Kjellin, Frick, and Girod furnaces, working on cold scrap, appear to demonstrate the effectiveness of the design of the Frick furnace and the superiority of the induction type over the arc type. In a run of 6 weeks' duration the output of the Kjellin and Frick furnaces, both of 10 tons capacity, was 696 and 850 tons respectively. Average results with the Frick furnace (10 tons) and the Girod furnace (12 tons) showed the kilowatt-hours per ton of steel to be 600 and 1000 respectively, the loss of power being three times more in the Girod than in the Frick furnace, although the capacity of the latter is only 20 per cent. less. The practical energy-consumption and efficiency of the same three furnaces when treating steel are calculated, assuming a capacity in each case of

12 tons and the power consumption per ton capacity to be 100 kilowatts. The results obtained for percentage efficiency are stated to be :—Girod 40·5, Kjellin 67·6, and Frick 73·6; for daily production in tons :—Girod 159, Kjellin 190, and Frick 250. A 3-ton double-ring furnace for ferro-manganese is able to produce during six days, allowing 23·5 hours lost for stops between heats, 98·7 tons of ferro-manganese, tho practical energy-consumption being 542 kilowatt-hours per ton. A 10-ton furnace for melting cold scrap is able to produce 37 tons in 24 hours, absorbing 950 kilowatts, the practical energy-consumption being 587 kilowatt-hours per ton. In steel refining, the practical energy-consumption will, as a rule, be less than 90 kilowatt-hours per ton of steel. The chemical reactions taking place in the furnace during refining may be carried out in the order :—removing carbon, silicon, phosphorus, and oxygen, recarburising and making alloys with Si, Mn, Ni, Cr, W, and the like.—T. St.

Cementation with mixed carburizing agents. A. Portevin. Mem. Soc. Ing. Civils de France, 1913, **66**, 347—383. (See also Giolotti, this J., 1911, 1017, 1215.)

THE author describes experiments on a practical scale of cementation with mixed agents, *i.e.* with a layer of wood charcoal of considerable thickness through which a current of carbon dioxide is passed at the temperature of cementation. The advantages of this method of cementation are described in detail.—W. H. P.

Chrome-vanadium rolled steel wheels (United States). Times Eng. Suppl., Dec. 17, 1913.

THE Grand Trunk Railroad recently ordered 400 heat-treated chrome-vanadium rolled steel wheels for the tenders of 50 Mikado type locomotives under construction at the Montreal Locomotive Works. The tenders have a capacity of 9,000 gallons of water and 15 tons of coal, making a full load of 172,000 lb., or an average load of 21,500 lb. per wheel. Some of these wheels made by the Standard Steel Works Company and the Carnegie Steel Company were subjected to drop tests as well as to the usual physical and chemical examinations—the first tests of this character made on such wheels. In the drop tests made by the Carnegie Company the anvil of the drop testing machine consisted of a heavy steel circular block recessed in the centre for the reception of the hub, so that the wheel was supported on the rim. The anvil in turn rested on a solid steel base, making an absolutely rigid foundation. The tup weighed 2,000 lb., and was guided between two uprights to ensure a square blow. Two wheels were selected at random for test, one from each of two different heats. The wheel was first placed with the concave face of the plate up, or in a position in which it offered the least resistance to side thrust. In this position it was subjected to two blows at 10 ft. and 25 blows at 16 ft., equivalent to 840,000 ft.-lb., without crack or fracture. The total deflection of the hub was $\frac{1}{4}$ in. The wheel was then reversed with the convex side of the plate up and subjected to five blows from a height of 16 ft. before it broke. The total deflection of the plate was $\frac{9}{16}$ in. The wheel thus withstood a total of 1,000,000 ft.-lb. before cracking or breaking. The second wheel was tested in the same manner except that all the blows were delivered from a height of 16 ft. In this case the total energy expended to break the wheel was 896,000 ft.-lb. Similar tests by the Standard Steel Works Company on their wheels showed an expenditure of 1,254,000 ft.-lb. before cracking or breaking. Physical tests made on various portions of the broken wheels by the American Vanadium Company showed the tensile strength to vary from 118,000 lb. to 150,000 lb. per sq. in. with an elastic limit approximating to 70 to 80 per cent. of the tensile strength. The chemical composition was normal, the chromium and vanadium content averaging about 1 per cent. and 0·16 to 0·20 per cent. respectively, with the carbon varying from 0·55 to 0·65 per cent. Hardness tests made on both sets of wheels by the Brinell and scleroscope methods showed a practically uniform hardness throughout the entire section, the scleroscope hardness being 44 to well below the limit of wear line, with an average Brinell hardness of 286, as made on the Carnegie wheels.

Alloys; Electrolytic separation of —— and their metallographic and mechanical examination. I. Iron nickel alloys deposited at ordinary temperatures. R. Kremann, C. T. Suchy, and R. Maas. Monatsh. Chem., 1913, **34**, 1757—1809.

ON electrolysing solutions containing nickel and ferrous sulphates using iron anodes, iron-nickel alloys separated at the cathode, the ratio of nickel to iron in the deposit being much smaller than in the electrolyte. In neutral electrolytes the ratio Ni : Fe in the deposit increased very slowly when the ratio $NiSO_4 : FeSO_4$ in solution was increased. The composition of the alloy depended also on conditions of deposition. Loose dendritic deposits contained less nickel than massive deposits. In this connection the material of the cathode (iron or carbon) and the current density were of great importance, but small variations in current density which did not greatly affect the coherence of the deposit had no influence on the composition of the alloy. The alloys showed the same brittleness (due to hydrogen) as is exhibited by pure electrolytic iron. Addition of potassium oxalate to the bath caused an increase in the proportion of nickel deposited. After electrolysis had proceeded for some time a greenish grey deposit formed near the cathode which rendered it difficult to obtain the alloys in quantity. In depositing thin layers of iron-nickel alloy on iron, the different expansion coefficients caused the deposits to be only rarely adherent. On adding sulphuric acid to the bath in increasing concentration it first slightly increased and then decreased the proportion of nickel, and finally prevented the deposition of metal entirely at quite a low concentration. When citric acid was added to the electrolyte it was consumed in the electrolysis and the alloy deposited contained from 0·5 to 1·1 per cent. C. Like potassium oxalate, but not so markedly, citric acid seemed to favour the separation of nickel. The cathode mud was not obtained in presence of citric acid, and it was therefore possible to obtain thicker deposits especially on carbon. The metallographic study of the alloys showed considerable analogy with nickel-steel prepared in the usual way, although spherulitic formations were frequent, and structures similar to those of meteorites were often found. The carbon appeared to be present as temper-carbon, somewhat irregularly distributed. There was a distinct lamellation in the direction of the current, but this disappeared on raising to a white heat, with great improvement in the mechanical properties. Hardness tests were also carried out on the alloys, the results being tabulated along with composition and method of preparation.—W. H. P.

Arsenic; Iodometric determination of —— in iron and its ores after precipitation with hypophosphorous acid. L. Brandt. Chem.-Zeit., 1913, **37**, 1445—1447, 1471—1472, 1496—1498.

THE precipitation of arsenic in the elementary form by means of hypophosphorous acid (see Engel and Bernard, this J., 1896, 381) and its subsequent determination iodometrically, can be conducted in relatively large quantities of liquid and without a condenser. On dissolving the precipitate in iodine solution, then adding bicarbonate and titrating in presence of starch, the total iodine consumption is 10I for 2As. The arsenic can also be determined by adding a mixture of potassium iodide and iodate to the precipitate and titrating the iodine liberated. The reactions are as follows: $2As+6I+3H_2O=As_2O_3+6HI$, and then $6HI+KIO_3=3H_2O+KI+6I$, and $6H_3AsO_3+5KI+KIO_3=6KH_2AsO_3+6I+3H_2O$, one atom of arsenic being equivalent to one atom of iodine. This method is more rapid than the other, and nearly as accurate.. On comparing the results of the precipitation and distillation methods, it is found that the latter gives less exact results. Some of the reasons for this have been described previously (this J., 1909, 1169), and it is also found that the presence of small quantities of higher oxides of manganese in iron ores affects the distillation. The method is also suitable for the determination of arsenic in pyrites.—W. H. P.

Cyanidation; Experiments in ——. L. Cohen. Min. and Eng. World, 1913, 933—934. (See also this J., 1912, 437).

A certain ore assaying 0·81 oz. Au showed an extraction of 88·3 per cent. after one hour's agitation: more prolonged agitation (up to 8 hours) resulted in a poorer extraction (85—86 per cent.) with the same cyanide consumption: the decomposition of the cyanide seemed to be the important factor in the rapid solution of the gold, after which some gold was re-precipitated and did not re-dissolve for a long time. Another ore (0·205 oz. Au, 1·74 oz. Ag) was cyanided with and without addition of lime. In the former case the extraction figures were: Au 61·0, Ag 8·0 per cent.; in the latter, Au 85·4, Ag 51·1 per cent., though much hydrocyanic acid was liberated. In some cases minerals present in an ore assisted extraction, and if the dressed products were cyanided separately this would result in a poorer extraction than the treatment of the undressed ore.—W. R. S.

Gold and silver; Assay of ——, *by iron-nail method.* E. J. Hall and C. W. Drury. Eng. and Min. J., 1913, **96**, 1125—1126.

Mixtures of silica and iron pyrites, containing from 6 to 89 per cent. FeS_2, in addition to 48·1 oz. Au (as finely divided metal) and 147·54 oz. Ag (as sulphide) per ton of 2000 lb., were assayed in parallel by the iron-nail, iron-nail and argol, and nitre methods. ½ A.T. (14·58 grms.) of mixture being used in each case; and determinations made of the total- and sulphide-sulphur present in the slags from the iron-nail charges. Except when the sulphide content of the charge was practically all oxidised by the litharge present, low results for silver were obtained by the nail methods; the loss of silver increased with the sulphide content, attaining a maximum of 10 per cent. with charges in which nails alone were used, and of 15 per cent. with those containing both nails and argol. The results for gold by the nail method, with and without argol, were irregular but generally about 1 per cent. low. Uniformly good results for both gold and silver were obtained by the nitre method, although as much as 30 grms. of nitre was necessary for some of the charges. —W. E. F. P.

Platinum metals; Detecting —— *in beads from cupellation.* (*Part II.*) C. O. Bannister and G. Patchin. Inst. Min. and Met., Dec. 18, 1913. [Advance proof.] (See also this J., 1909, 606.)

The presence of platinum metals in cupellation beads can be detected by examining the surface appearance of the cool bead under a low power objective, such as a 1 in. or a ⅔ in. Photographs showing characteristic structures are given. *Platinum.* 1·6 per cent. Pt in silver produces changes visible to the naked eye, and 0·3 per cent. can be detected with certainty under the microscope. The boundaries of the crystals become distorted, and a banded structure develops. The effect of platinum on gold is similar but less marked. Beads containing equal quantities of silver and gold have the "frosted surface" appearance caused by over 2 per cent. Pt. *Iridium* makes the bead more spherical. Under the microscope, the crystal faces appear strongly marked with lines crossing one another after the manner of slip bands. The marks are ascribed to internal stresses resulting from occluded oxygen. The effect due to 0·4 per cent. Ir is clearly visible. *Rhodium.* Traces of rhodium, such as 0·004 per cent., in silver beads, cause a distinct crystallisation visible to the naked eye. With 0·03 per cent. Rh. and upwards, the beads spit persistently, and assume a blue-gray colour. Gold with 0·2 per cent. Rh has a ruby colour, and with 0·8 per cent. is covered with a black film. *Ruthenium* produces a black crystalline deposit at the edge of the bead near the bottom, and gives a "single-sided herring-bone structure" to the surface of the bead. The deposit with 0·004 per cent. Ru is small but distinctly visible to the naked eye. No increased tendency to spit was observed. *Palladium.* The effect is similar to that of platinum, and palladium may be detected by a colouration of the parting acid, even 0·0002 grm. Pd producing a faintly yellow colour. *osmium* up to 2 per cent. gives no characteristic appearance to the silver bead, and *osmiridium* gives similar results to those obtained with iridium alone.—T. St.

Bronzes; Analysis of ——. K. Schenck. Chem.-Zeit., 1913, **37**, 1464.

The sample (1 grm.) is dissolved in as little nitric acid as possible (say 10 c.c.) in a 300 c.c. beaker, the solution evaporated almost to dryness, 200 c.c. of water and 3 c.c. of dilute nitric acid added, the liquid heated to boiling, and after standing overnight the metastannic acid is filtered off and washed with 1 per cent. nitric acid; any foreign metals in this are determined, after weighing, in the usual way. In the filtrate the copper and lead are determined electrolytically, using a rotating electrode, and a current of 2 ampères at 8 volts in the hot solution; after washing, the cathode is dried at 100° C., but the lead peroxide on the anode requires an hour at 180° C. The residual solution is evaporated to small bulk, the iron (and any aluminium) precipitated by ammonia, and after filtering, the solution is evaporated to dryness with a little sodium hydroxide, the residue treated with water and evaporated with sulphuric acid to expel nitric acid, then treated with 150 c.c. of water and 10 grms. of solid sodium hydroxide, and the hot alkaline solution electrolysed as before, the zinc being deposited on the cathode already coated with copper.—J. T. D.

Corundum; Assay for ——, *by mechanical analysis.* W. S. Hutchinson. Min. and Eng. World, 1913, 972.

The corundum content of a hard, crystalline gneiss composed mainly of quartz, felspar and mica and containing up to 8 or 9 per cent. each of red garnet and corundum, the latter occurring as minute grains and as well defined crystals up to ½ in. in length and being usually present in much smaller quantity than the garnet, was determined as follows:—500 grms. of the 4-mesh sample having been "scoured" with water in an iron bucket by means of a wooden block, the mica thus loosened was floated off with water and the residue dried and graded, by sifting, into 7 portions of which the finest passed through a 14-mesh screen. As much as possible of the clean corundum was picked out by hand from each of the six coarser portions, the remainders of which, together with the fine portion, were then mixed, crushed to pass a 30-mesh sieve and "panned" repeatedly to produce a concentrate containing practically the whole of the corundum and garnet. From the dried concentrate (containing about 20 per cent. of quartz and felspar) the garnet was removed by means of an electro-magnet, after which the corundum (sp. gr. about 4) was separated from the residue by means of a heavy liquid (a solution of mercuric iodide in potassium iodide) of sp. gr. 3·1. —W. Patents.

Manganese-steel; Method of forming machined shapes of ——. W. S. Potter, New York. U.S. Pat. 1,079,439, Nov. 25, 1913.

To obtain metal with a texture (between a tough, austenitic and a fragile, coarse-grained, martensitic structure) having relatively weak cleavage planes, whereby machining is facilitated, the casting is maintained between 640° and 720° C. for 15—60 mins. per inch of its thickness and then cooled; after machining, it is maintained between 975° and 1075° C. for 5—15 mins. per inch of thickness and then rapidly cooled to below 420° C.—W. E. F. P.

Iron and steel ; Process for the treatment of ——, to form a permanent black finish thereon. W. R. Swan, Bridgeport, Conn. U.S. Pat. 1,079,453, Nov. 25, 1913.

The metal whilst hot and in the presence of copper sulphate, ammonium chloride and glucose, is subjected to the action of superheated steam, then cooled and immersed in heated paraffin oil.—W. E. F. P.

[Steel.] Case-hardening mixture. J. F. Sallows, Lansing, Mich., Assignor to A. O. Blaich, Chicago, Ill. U.S. Pat. 1,079,954, Dec. 2, 1913.

A mixture of 65—70 per cent. of spent tan bark, 12—15 of barium carbonate, 10 of sodium chloride, 8—10 of laked lime and 2½ of ammonium carbonate.—W. E. F. P.

Steel ; Apparatus for manufacturing and refining ——. J. W. Latcher, Edinburg, N.Y. U.S. Pat. 1,080,224, Dec. 2, 1913.

A crucible or pot, lined with refractory material and which can be whirled about its own axis while heated internally by means of a flame projected downwards. —W. E. F. P.

[Lead and zinc] Ores ; Treatment of ——. S. L. Bensusan, London. Eng. Pat. 26,350, Nov. 16, 1912.

The ore or concentrate is fed in a slow and continuous stream into an inclined rotary furnace, where it is roasted and simultaneously subjected to jets of steam. Agglomeration of the ore is thus avoided. The zinc and silver are almost wholly converted into sulphates and may be separated from the lead by leaching. The roasting temperature is attained by the admission of hot gases from a supplementary furnace into the roasting furnace at its discharge end, and the temperature is afterwards regulated by the admission of furnace gases, heated air, or cold air, as required.—T. St.

Zinc compounds ; Process of reducing ——. E. B. Cutten, Erie, Pa. U.S. Pat. 1,080,102, Dec. 2, 1913.

The reduction of oxide or other compound of zinc free from slag-forming material is effected by means of reducing gases or/and carbon at a high temperature and under a pressure sufficient to prevent volatilisation of the metal, which is thus recovered in liquid form.—W. E. F. P.

Metalliferous sands or slimes ; Treatment of ——. A. J. Boult, London. From R. H. Kendall, Marikuppam, India. Eng. Pat. 27,320, Nov. 27, 1912.

A combined settling tank and agitator for the treatment of slimes, consists of a vertical tube in which the pulp is agitated, and a cylindrical settling tank with a conical bottom surrounding the upper part of the agitator. The thick pulp passes from the bottom of the settling tank through adjustable openings into the agitator, and the clear liquid is run off into a launder encircling the settling tank. The pulp is agitated with a suitable solution in the agitator, and is transferred to the next settling tank of a series, by air-lift, or by means of a pump. Arrangements of both kinds are described.—T. St.

Nickel ; Recovery of —— from its ores. H. L. Sulman, H. F. K. Picard, and A. E. Roberts, London. Eng. Pats. 27,626, Nov. 30, 1912, 3814, Feb. 14, and 6703, March 18, 1913.

Freshly crushed garnierite ores are mixed mechanically with a quantity of sulphuric acid (75 to 80 per cent. strength) insufficient to dissolve all the nickel. The mixture becomes hot and the silica dehydrated, and a dry porous mass is left. After addition of water, the pulp is filtered, and the solution, containing sulphates of magnesium, nickel and iron, and small quantities of other substances, is oxidised and then neutralised with calcium carbonate. The solution of nickel and magnesium sulphates is filtered, treated with powdered magnesia or milk of lime, and the precipitated nickel hydroxide is separated and roasted.—T. St.

Aluminium solder. S. R. Bailey, and Navaltum, Ltd., London. Eng. Pats. 27,835, Dec. 3, 1912, and 12,972, June 4, 1913.

Aluminium solders specially designed to withstand the action of sea water are composed of :—(1), Al 1, phosphor tin (5 per cent. P) 0·5, Zn 2, Sn 24, soft solder 0·5 parts by weight ; (2), Al 0·5, Sn 4·25, phosphor tin 0·25 parts by weight.—T. St.

Ores ; Treatment of sulphuretted, oxidised, carbonated and other ——. N. H. M. Dekker, Paris. Eng. Pat. 28,857, Dec. 14, 1912.

The mixed sulphates obtained as described in Eng. Pat. 18,488 of 1911 (this J., 1912, 930) are crystallised and then treated at a particular temperature with a saturated solution of one or more of the sulphates. Certain of the sulphates are thus dissolved, leaving one or more undissolved. The temperature of the separated solution is then altered to bring about a separation of the sulphates present. The treatment of the following mixtures of crystallised sulphates is described :—(1) sodium and iron sulphates, (2) magnesium, sodium, and iron sulphates, and (3) sodium, iron and copper sulphates.—T. St.

Agitating and mixing apparatus for liquid slimes. W. Symmes, Virginia City, Nev., U.S.A. Eng. Pat. 4023, Feb. 17, 1913.

The agitator consists of a cylindrical vessel with a central rotating shaft. From horizontal arms attached to the upper end of the shaft are suspended adjustable air-lift pipes, up which the slime is drawn by suction, and discharged again into the upper part of the vessel—T. St.

Magnetic separator ; Rotary ——. E. C. R. Marks, London. From Maschinenbau-Anstalt Humboldt, Cöln-Kalk, Germany. Eng. Pat. 11,430, May 16, 1913.

The distance between a stationary pole piece and the several polar surfaces of a rotating magnetic ring is adjusted by moving the stationary pole piece in the vertical plane of the movement of the material being treated. The material may thus be made to travel across a magnetic field of uniform strength, or the intensity of the field may be made to increase in the direction of movement across the field.—T. St.

Metal articles ; Compound ——. T. Prescott, Huddersfield, Yorks. Eng. Pat. 19,198, Aug. 25, 1913.

In joining together metals having different melting points, the more easily fusible metal or alloy is covered with a thin sheet of mild steel tinned on both sides, and the metal of higher melting point is then applied in the molten state to the free side of the mild steel sheet. It is essential that the temperature of the molten metal shall not be higher than the melting point of the mild steel. The tin alloys with the steel sheet and with the two metals, and these thus become firmly united. To manufacture cast iron tubes lined with copper or lead, tubes of copper or lead are supported on mandrels, the tinned steel sheet tightly lapped over, and melted cast iron then run round them in vertical moulds.—T. St.

Roasting-furnace. E. J. Fowler, Redwood City, Assignor to Pacific Foundry Co., San Francisco, Cal. U.S. Pat. 1,079,405, Nov. 25, 1913.

A furnace in which the charge is propelled from the highest to the lowest of a series of superposed chambers by means of rotating, hollow rabble-arms actuated from and communicating with a central, hollow shaft through which air is transmitted ; each rabble-arm is closed at its outer end and divided internally, by means of a longitudinal partition, into two communicating channels through each of which, in succession, the air from the shaft passes before entering the roasting chamber. —W. E. F. P.

Copper; Process of hardening ——. Process of treating metals [copper]. J. A. McLarty, Toronto, Canada. U.S. Pats. 1,079,786 and 1,079,787, Nov. 25, 1913.

(1) Copper is coated with a material containing a carbohydrate (sugar), heated to about 1600° F. (871° C.), and allowed to cool out of contact with air. (2) The metal (copper) is exposed while hot to the vapours obtained by heating a mixture containing a fat and a carbohydrate to a temperature below that necessary for the production of carbon monoxide; the mixture and the metal are not in contact.—W. E. F. P.

Ore-reducing process. J. A. McLarty, Toronto, Canada. U.S. Pat. 1,079,788, Nov. 25, 1913.

The ore, at a temperature below red heat (750°—800° F., 399°—427° C.), is subjected to the action of a reducing gas obtained by treating with a hydrocarbon the gases resulting from the combustion of carbonaceous fuel with an excess of air.—W. E. F. P.

Metals; Process of smelting ——. J. D. Hilliard, Albany, N.Y., Assignor to New England Metal and Machine Co., Boston, Mass. U.S. Pat. 1,080,344, Dec. 2, 1913.

The ore, mixed with a solid reducing agent, is progressively heated and partly reduced, without fusion, by means of hot gases, while passing along an inclined, rotating cylinder to a closed melting or reduction chamber heated by electrical means. The upper end of the cylinder has a closed, funnel-shaped extension with a charging opening and an outlet for the withdrawal, by suction, of the gases produced in the chamber.—W. E. F. P.

Tool-steel; High-speed ——. R. Becker, Crefeld, Germany. U.S. Pat. 1,081,263, Dec. 9, 1913.

See Eng. Pat. 27,838 of 1912; this J., 1913, 430.—T.F.B.

Steel; Process for improving the physical properties of ——. V. Stobie. Fr. Pat. 460,151, July 8, 1913. Under Int. Conv., July 9, 1912.

See Eng. Pat. 16,001 of 1912; this J., 1913, 831.—T.F.B.

Steel and compounds of steel; Process for producing a fibrous structure in ——. J. Churchward. Fr. Pat. 460,212, July 10, 1913.

See U.S. Pat. 1,069,387 of 1913; this J., 1913, 870.—T.F.B.

Ores; Process of roasting fine ——. W. Buddeus, Wiesbaden, Germany, Assignor to J. Dern, Salt Lake City, Utah. U.S. Pat. 1,079,897, Nov. 25, 1913.

See Fr. Pat. 425,109 of 1911; this J., 1911, 904.—T. F. B.

Alkali metals; Method of producing ——. J. E. Bucher, Coventry, R. I. U.S. Pat. 1,079,974, Dec. 2, 1913.

See Fr. Pat. 453,086 of 1913; this J., 1913, 756.—T. F. B.

Metal surfaces; Process for producing clean or deoxidised ——. J. A. Hatfield and C. R. Yates, Newport. U.S. Pat. 1,080,059, Dec. 2, 1913.

See Eng. Pat. 27,949 of 1911; this J., 1913, 93.—T. F. B.

Aluminium alloys. W. N. Naylor, Forest Hill, and S. P. Hutton, Beckenham. U.S. Pats. 1,080,155 and 1,080,156, Dec. 2, 1913.

See Eng. Pats. 27,382 of 1911 and 15,689 of 1912; this J., 1912, 994.—T. F. B.

Converter process. O. Thiel, Landstuhl, Germany. U.S. Pat. 1,080,606, Dec. 9, 1913.

See Fr. Pat. 415,042 of 1910; this J., 1910, 1314.—T. F. B.

Smelting or refining of metals and the like in crucibles. H. G. Solomon, London. U.S. Pat. 1,081,164, Dec. 9, 1913.

See Eng. Pat. 9031 of 1911; this J., 1912, 496.—T. F. B.

Stirrers and mechanical furnaces suitable for roasting or for roasting and drying ores and similar substances. O. Spinzig and W. Hommel. Fr. Pat. 460,127, July 3, 1913. Under Int. Conv., July 5, 1912.

See Eng. Pat. 15,778 of 1912; this J., 1913, 915.—T. F. B.

Furnace; Rotary ——. J. Churchward. Fr. Pat. 460,211, July 10, 1913.

See U.S. Pat. 1,069,601 of 1913; this J., 1913, 900.—T. F. B.

Ores; Process and apparatus for treating ——, especially applicable to roasting pyrites before further treatment. E. R. Sutcliffe. Fr. Pat. 460,264, July 11, 1913. Under Int. Conv., July 13, 1912.

See Eng. Pat. 16,450 of 1912; this J., 1913, 1115.—T.F.B.

Barytes; Process for separating —— from minerals. C. J. Greenstreet. Fr. Pat. 460,495, July 15, 1913.

See U.S. Pat. 1,069,545 of 1913; this J., 1913, 871.—T.F.B.

Thallium and rare metals from lead ores; Process and apparatus for separating ——, with simultaneous production of sublimed white lead. Deutsche Felsen Oel Ges. Franzen und Co. Fr. Pat. 460,825, July 28, 1913. Under Int. Conv., July 30, 1912.

See Ger. Pat. 264,526 of 1912; this J., 1913, 1078.—T.F.B.

XI.—ELECTRO-CHEMISTRY.

Application of electricity [and radioactivity] to agriculture. Baker. *See* XVI.

Patents.

Electrodes for electric furnaces. F. Krupp A.-G., Essen, Germany. Eng. Pat. 17,925, Aug. 6, 1913. Under Int. Conv., Sept. 18, 1912.

A metallic water-cooled head fits loosely by means of a screw-threaded shank into a screw-threaded hole in the electrode, and the clearance space between the threads is filled with an easily fusible metal.—B. N.

Thermo-electric element. A. L. Marsh, Assignor to Hoskins Manufacturing Co., Detroit, Mich. U.S. Pat. 1,076,438, Oct. 21, 1913.

The positive thermo-electric element consists of nickel containing from 3 to 5 per cent. Si, with a suitable quantity of manganese added to remove brittleness.—B. N.

Electrolytes; Heating molten ——. F. von Kügelgen, Holcombs Rock, Va., and G. O. Seward, East Orange, N.J., Assignors to Virginia Laboratory Co., New York. U.S. Pat. 1,080,113, Dec. 2, 1913.

In the electrolysis of molten salts, the heating effect of the current is supplemented by introducing into the electrolyte a hollow body (which may be one of the electrodes) heated internally by an injected gas flame. —W. E. F. P.

Furnace; Electric ——. G. Massip, Levallois-Perret, France. U.S. Pat. 1,080,840, Dec. 9, 1913.

See Eng. Pat. 19,172 of 1912; this J., 1912, 1134.—T. F. B.

Production of hydrogen and oxygen by electrolytic processes. Eng. Pat. 1812. *See* VII.

Process and apparatus for the electrolysis of halogen alkalis. Eng. Pat. 18,102. *See* VII.

Sterilisation or purification of wines, beers, and other similar fermented liquids. Fr. Pat. 460,487. *See* XVIII.

Sterilisation of milk. Eng. Pat. 26,743. *See* XIXa.

Purifying and sterilising liquids. U.S. Pat. 1,079,377. *See* XIXb.

XII.—FATS; OILS; WAXES.

Oils and fats: Report of Committee of Amer. Leather Chemists' Assoc. (1913) *on* ——. J. Amer. Leather Chem. Assoc., 1913, **8**, 496—504. (See also this J., 1913, 37.)

A summary of results obtained by members of the committee on the analysis of "a supposedly pure sulphonated cod oil" and the same oil with the addition of 5 per cent. of mineral oil. *Water.* The distillation method was found more accurate than drying with sand for 16 hours at 95°—100° C. 50 grms. of oil are distilled in a 250—300 c.c. flask with 75 c.c. of xylene saturated with water until the distillate is clear. The condenser is washed with xylene and the volume of water in the distillate measured. *Non-saponifiable matter.* Satisfactory results were obtained by either of the two following methods. (1) 10 grms. of the oil are boiled under a reflux condenser for 60 mins. with 25 c.c. of 10 per cent. alcoholic potash and 100 c.c. of petroleum ether (b. pt. 40°—75° C.), then treated with 100 c.c. of water, cooled, the ether layer washed 3 to 5 times with 100 c.c. of water, the soap solution shaken 3 times with ether, and the combined ether extracts washed with water and evaporated as usual. (2) 5 grms. of oil are treated, in an 8 oz. Erlenmeyer flask, with 5 c.c. of aqueous 50 per cent. caustic potash, 45 c.c. of alcohol, 25 c.c. of petroleum ether and some glass beads. After boiling for an hour or more the mixture is extracted with ether as usual, alcohol being used to break the emulsion. *Combined SO_3.* Accurate results are obtained by boiling 4 grms. of oil with 30 c.c. of hydrochloric acid (1 : 5) for 40 mins. with frequent shaking, and after cooling, shaking with petroleum ether, washing the ethereal layer with water, and precipitating sulphuric acid in the aqueous solution as barium sulphate. The amount of sulphuric acid present as ammonium sulphate, etc., is found by dissolving a weighed quantity of the oil in ether, shaking several times with a few c.c. of strong brine free from sulphates, and determining the sulphuric acid as barium sulphate. *Total fat.* Accurate results are obtained by dissolving 10 grms. of oil in 50 c.c. of water, boiling for 5 mins. with 25 c.c. of hydrochloric acid (1 : 5), cooling, shaking twice with 100 c.c. of ether, washing the ether extract with water and evaporating. The total fatty oil should be calculated from the difference between 100 per cent. and the sum of the water, ash, and unsaponifiable matter. The following is suggested as a specification basis for the purchase of sulphonated oils:—The standard shall be 70 per cent. of total fatty oil. Any oil tendered which tests 71 per cent. or over shall be paid for at a *pro rata* increase calculated as from the 70 per cent. standard. Any oil which tests under 70 per cent. but is 68 per cent. or over shall be subject to a reduction of 1½ times the shortage calculated at *pro rata* price from 70 per cent. If the test falls below 68 per cent. the buyer shall have the right of rejection.—D. J. L.

Whale oil; Production and utilisation of ——. H. T. Offerdahl-Larvik. Ber. deutsch. Pharm. Ges., 1913, 23, 558—569.

The world's total output of whale oil in 1912 was about 1,200,000 barrels (1 barrel=about 170 kilos.), more than half of which came from the Norwegian fisheries. In 1904—1905 the cost of production of each ton of whale oil was about 250 kr. (£13 15s. 6d.); but last year owing to increased wages and cost of fuel, the cost was about 350 kr. (£19 5s. 9d.). After separation of the greater part of the oil the residual flesh and bones are dried at about 300° to 400° C., finely divided and again pressed. They are then again dried, ground up, sifted and mixed in suitable proportions for guano. A good sample should contain 10 to 12 per cent. of nitrogen, and 14 to 15 per cent. of phosphoric acid, with not more than 2 to 3 per cent. of oil. A whale of average size yields 40 to 50 sacks (of 100 kilos.) of guano of this composition, worth about 10 to 12 M. per sack (5s.—6s. per cwt.). Until seven years ago there was only a limited demand for whale oil, which was mainly used for the production of glycerin and fatty acids. It is now hydrogenated, exclusively for soap-making, but in the author's opinion hardened whale oil is suitable for food. With regard to the small amount of nickel present in the hardened oil, experiments showed that when 0·5 grm. of nickel powder was taken daily no ill-effects were experienced, and that 99·8 per cent. of the metal was rapidly excreted from the system. Hardened whale oils were free from bacteria.—C. A. M.

Oleic acids; Isomeric ——. A. Eckert and O. Halla. Monatsh. Chem., 1913, **34**, 1815—1824.

Hydriodic acid was absorbed by 2.3-oleic acid with the formation of β-iodostearic acid. When the latter was treated with alcoholic potassium hydroxide solution only traces of 2.3-oleic acid were formed, the bulk being converted into the isomeric 3.4-oleic acid. In like manner this new acid was transformed into a 4.5-oleic acid. The iodine values of these isomeric acids, in which the double linkage had been moved further from the carboxyl group, differed widely from the normal value (89·4) of oleic acid: (2.3-oleic acid, 9·04; 3.4-oleic acid, 16·27; and 4.5-oleic acid, 26·96).—C. A. M.

Radium emanation; Action of —— *on lipase.* E. K. Marshall, jun., and L. G. Rowntree. J. Biol. Chem., 1913, **16**, 379—384.

The rate of decomposition of ethyl butyrate by the lipolytic enzymes of pig's liver and castor oil seeds, was not accelerated, but possibly slightly retarded, by the influence of radium emanation.—J. H. L.

Patents.

Catalytic material [*for hydrogenating oils*]; *Process of making* ——. C. Ellis, Montclair, N.J. U.S. Pat. 1,078,541, Nov. 11, 1913.

Unreduced material, preferably containing a reducible metallic derivative, is conveyed through a zone of hydrogen or other reducing gas, maintained at a reducing temperature and free from catalyser "toxins," and the pyrophoric catalysing material produced is transferred to a body of oil, without deleterious contact with air.—F. Sodn.

Reduction or hydrogenation of organic compounds, especially the fatty acids and their compounds; Process of the ——. K. H. Wimmer, Bremen, Germany, and E. B. Higgins, Wallasey. U.S. Pat. 1,081,182, Dec. 9, 1913.

See Fr. Pat. 441,097 of 1912; this J., 1912, 826.—T. F. B.

XIII.—PAINTS; PIGMENTS; VARNISHES; RESINS.

Iron and steel; Protection of —— *by paint films.* N. A. Dubois. J. Ind. Eng. Chem., 1913, **5**, 968—971.

Comparative tests made with five paints of exactly the same composition except that in one case a pure linseed oil vehicle was used, whereas in the others the vehicle contained 5, 10, 20 and 30 per cent. respectively of "kauri mixing varnish," indicated that the films given by the paints at the two ends of the series were inferior to those given by the intermediate paints, *i.e.*, with increasing additions of "kauri mixing varnish," the protective effect of the paint film increased up to a certain point and then diminished. "Blue lead" gave results similar in many ways to those obtained with red lead when used as a priming coat for iron and steel; and by proper selection of sizes of particles in accordance with the law of minimum voids, the protective power of red lead paints was considerably improved. Experimental results indicated that the efficacy of the paint film depended mainly on its impermeability to gases and water vapour rather than to the chemical nature of the pigment, and the supposed rust-inhibiting properties of certain alkaline or basic pigments are probably due to the formation of a small quantity of a metallic soap, which lessens the permeability of the paint film.—A. S.

Oleoresins of Jeffrey and singleleaf pines. A. W. Schorger. J. Ind. Eng. Chem., 1913, **5**, 971—973.

The oleoresin of the singleleaf pine (*Pinus monophylla*) yielded 19·00 per cent. of volatile oil, 79·63 of colophony (grade N), 0·11 of "trash," needles, bark, etc., and 1·26 per cent. of water. The oil (sp. gr. 0·8721—0·8733 at 15° C., n^{15}_{D} = 1·4732—1·4733, a^{25}_{D} = +14·41° to +17·26°) contained 80—85 per cent. of *d*-*a*-pinene, 4—5 of *l*- or i-limonene, and 4—6 per cent. of *d*-cadinene. The colophony (acid value, 155·9, saponif. value, 163·3) contained 7·22 per cent. of resene, and resin acids (m. pt. 129°—130° C., completely liquid at 135° C.), isomeric with abietic acid. The oleoresin of the Jeffrey pine (*P. jeffreyi*) yielded, on the average, 9·96 per cent. of volatile oil, 87·88 of colophony, 0·47 of "trash," and 1·69 per cent. of water. The oil (sp. gr. 0·6951—0·7110 at 15° C., n^{15}_{D} = 1·3927—1·4060) contained about 95 per cent. of *n*-heptane and 5 per cent. of an aldehyde, probably citronellal. The colophony (acid value, 147·6; saponif. value, 178·1) contained 12·5 per cent. of resene, and resin acids (m. pt. 170°—171° C.) isomeric with abietic acid. (See also this J., 1912, 938.) —A. S.

Finnish pine oil: Examination of the first runnings of ——. O. Aschan. Z. angew. Chem., 1913, **26**, 709—713. (Compare this J., 1907, 1151, and 1898, 237.)

The following substances were found to be present in the fraction of Finnish pine oil boiling below 60° C.:—Acetaldehyde, acetone, furane, sylvane, propionic aldehyde, and a hydrocarbon, C_5H_{10}, forming about one-half of the fraction boiling at 28·5° to 29·5° C. The theory of wood distillation is discussed, and the author considers that these constituents of the pine oil are formed from the cellulose and other carbohydrates and the lignin in the wood, and not from the resins and terpenes. The difference between the tars from pine and from other woods is due to the presence in the pine-wood tar of partially decomposed pine resins.—A. T. L.

Para rubber seed oil. [*Suitability for linoleum manufacture.*] F. Fritz. Chem. Rev. Fett Ind., 1913, **20**, 295.

The oil has an iodine value (Wijs) of about 141 and can be converted without difficulty into a mass resembling linoxyn from linseed oil. In one experiment a dry friable oxidation product was obtained which was found (by Fahrion's petroleum ether method; this J., 1891, 1015), to contain 32·6 per cent. of non-oxidised acids and 52·7 per cent. of oxidised acids. When Para rubber-seed oil is heated to 200°—210° C. with 1 per cent. of metallic magnesium and then cooled, it sets to a transparent slightly sticky mass. A similar reaction is given by linseed oil and certain other drying oils.—R. G. P.

Fires in lacquer [*and gasoline*]; *Extinguishing* —— *with sawdust.* Factory Mutual Laboratories. Oil, Paint and Drug Rep., Dec. 8, 1913, 34.

Sawdust was found to extinguish burning inflammable liquids such as gasoline and lacquer very effectively and speedily, the efficiency being further increased by the addition of sodium bicarbonate. The sawdust floated on the liquids and blanketed the flames; it took fire only with difficulty and then burned without flame, so that it did not cause re-ignition. It was found to be immaterial whether the sawdust was moist or dry, or whether derived from hard or soft woods.—T. St.

Patents.

Protective covering to be applied as a paint. J. H. Williams, Litherland, and F. Hayes, Seaforth, Lancs. Eng. Pat. 1256, Jan. 16, 1913.

Finely ground Portland cement (20 vols.) is mixed with milk (80 vols.) and the mixture passed through a very fine sieve. Linseed oil and pigments are then added, and the whole is heated. The resulting paint is particularly suitable for coating iron and steel structures. Finely powdered asbestos may be added to make the paint fire resisting, and glue to increase the tenacity. As an example, such a paint may consist finally of:—Milk and cement 60, linseed oil 12, pigment 25, asbestos 3 per cent. —T. St.

Paint mills or the like. T., J. R., and H. N. Torrance, and Torrance and Sons Ltd., Bitton, Gloucester. Eng. Pat. 14,559, June 24, 1913. Addition to Eng. Pat. 14,733, June 24, 1912 (this J., 1913, 798).

An improved form of the paint mill previously described, designed to give greater strength and rigidity. The throw of the lower convex grinding member is variable, and its adjustment relative to the stationary upper concave member is effected from several points simultaneously by a single operation. The paint is mixed before grinding by means of paddles worked through gearing from the main shaft, and the several gears are arranged to work in oil baths. Peripheral and surface scrapers are actuated from a common member on a swivel shaft in synchronism with the wavering grinding member.—T. St.

White lead; Process of producing ——. E. Euston, St. Louis, Mo. U.S. Pat. 1,079,481, Nov. 25, 1913.

An approximately neutral solution of lead acetate is treated with carbon dioxide, and basic lead acetate is introduced into the solution at a rate proportional to the precipitation of white lead.—O. R.

[*Waterproofing and insulating*] *Composition.* T. D. Kelly, Southend-on-Sea, Essex. Eng. Pat. 21,943, Oct. 18, 1912.

From 10 to 30 per cent. of a mixture in equal proportions of gummy resins obtained from woody or cellulose materials, and a non-drying vegetable oil, is added to linseed or tungseed oil (or a mineral oil to which glycerin has been added), and the whole heated quickly to about 550° F. (288° C.), and then allowed to cool. An insulating, water- and heat-proof glue is prepared by adding from 2 to 30 per cent. of a mixture of Portland or magnesium cement and metallic oxides to the liquid composition. —T. St.

Compositions for impregnating or coating surfaces, binding colours, and addition to colours, principally for the purpose of rust prevention: Manufacture of ——. R. Eberhard, Munich, Germany. Eng. Pat. 27,894, Dec. 3, 1912.

See Fr. Pat. 451,719 of 1912; this J., 1913, 666.—T. F. B.

Lacquers and varnishes; Process for the manufacture of ——. A. Cohn, Neukölln, Germany. U.S. Pat. 1,080,100, Dec. 2, 1913.

See Fr. Pat. 441,703 of 1912; this J., 1912, 886.—T. F. B.

XIV.—INDIA-RUBBER; GUTTA-PERCHA.

Rubber; Preparation of [vulcanised] —— for analysis. L. Archbutt. Analyst, 1913, 38, 550—554.

The rubber grinding apparatus described consists of two solid grooved gun-metal rollers, 4 ins. long and 2½ ins. diam., mounted in bearings in a strong steel frame, which is provided with setting-up screws for adjusting the distance between the rollers. The grooves are V-shaped, 18 to the inch and $\frac{1}{20}$ in. deep, with rather sharp, smooth edges. The rollers can be geared together in the ratio 2 : 3, or the back roller may be fixed. The rubber is first cut up into pieces about ⅛ in. thick: these are passed between the rollers about three times with the wheels in gear, then with the back roller fixed. The character of the "powder" obtained varies from a "fine non-adherent powder" in the case of (*e.g.*) a rubber washer, containing 52 per cent. of mineral matter, to "very adherent particles" in the case of "very elastic black tubing" containing 1 per cent. of mineral matter. Prolonged grinding results in an increase in acetone extract, but not in alkali extract, though in the time required for preparing any of the samples referred to (not more than 10 mins.) there is no appreciable change in the amount of acetone-soluble material. Figures are quoted showing that eight hours extraction with acetone (in a Soxhlet extractor) is sufficient for all practical purposes.—E. W. L.

XVI.—SOILS; FERTILISERS.

Lime requirement of soils; Determination of the ——. J. A. Bizzell and T. L. Lyon. J. Ind. Eng. Chem., 1913, 5, 1011—1012.

Twenty-five grms. of the air-dried soil are digested with 50 c.c. of boiled water and 50 c.c. of $N/10$ baryta for 1 hour on the water-bath, then treated with 150 c.c. of water and 5 grms. of ammonium chloride, the liberated ammonia determined, and from the result the amount of baryta (or equivalent quantity of lime) absorbed by the soil is calculated, after allowing for the amount of ammonia liberated in a control determination without the baryta. —A. S.

Experimental results obtained of recent years by the section of Agricultural Chemistry of the Central Agricultural Experiment Station at Stockholm. H. G. Söderbaum. Bull. Agric. Intell. and Plant Diseases, 1913, 4, 1677—1681.

Nitrogenous manures. Wheat and rye were both more sensitive to cyanamide than were oats, *i.e.* dressings of cyanamide—even when applied a week before sowing—killed the majority of the plants in the case of wheat and rye. Only after sowing again did the plants develop normally. With oats the increased yield produced by cyanamide was nearly as good as that with sodium nitrate. With wheat and rye, the increase though marked was much less. Cyanamide manuring produced a straw with a remarkably high nitrogen content. Calcium nitrate was inferior to sodium nitrate with wheat, but equal to it with oats and rye. Dicyandiamide gave unmistakable poisoning with oats and a fall in yield. Dicyandiamidine sulphate or phosphate also caused the crops to be sickly and to develop very scantily. With oats ammonium sulphate gave as a rule better results than sodium nitrate. With barley a mixture of the two gave somewhat better results than nitrate alone, although ammonium sulphate alone was much inferior to nitrate. With rye ammonium sulphate was somewhat superior to nitrate, though with wheat the reverse was the case. Carrots and potatoes profited equally by either nitrate or ammonium sulphate. As a top dressing a mixture of cyanamide and calcium nitrate (2 of cyanamide to 1 of nitrate) gave better results with oats than either manure separately: even double doses showed no cyanamide poisoning when applied a week before sowing. All mixtures containing cyanamide were injurious when used as top dressings after the plants had appeared, although nitrates had a better effect when used in this way. With turnips ammonium sulphate was distinctly superior to sodium nitrate, giving 45 per cent. more fresh roots and 27 per cent. more dry matter.

Phosphatic manures. Using oats and barley, experiments extending over five years with superphosphate, precipitated bicalcium phosphate and tricalcium phosphate and steam bone flour, showed superiority of the lighter soluble phosphates. The superphosphate and bicalcium phosphate were about equal to each other and both superior to the other two, even in cases where the less soluble phosphates had been nearly as good as superphosphate in the first year. Calcium carbonate had little effect on the soluble phosphates during the five years, but it decreased and nearly obliterated the action of the other two phosphates. Partial replacement of sodium nitrate by ammonium sulphate always slightly increased the action of the less soluble phosphates. In these experiments the lower direct effect of the less soluble phosphates was not compensated by more favourable after effects. Taking the action of superphosphate as 100 the effect of Tunis phosphate on oats was 22, that of precipitated bone phosphate 111—117. Electrolytically precipitated bicalcium phosphate (Palmaer phosphate) gave a less favourable action than the normally precipitated product. Artificial iron phosphate gave about one-fifth of the superphosphate effect, and Bernard phosphate, prepared by calcination of low-grade crude phosphate, showed no effect at all. Nitrophosphate ("*Nitrat-phosphat*") obtained by treating crude phosphates with nitric acid, mainly a dicalcium phosphate but containing 3·6 per cent. N, had an action approximately the same as that of superphosphate.

Various other fertilisers. Nitroammonia lime ("*Nitrammonkalk*"), obtained by the action of quicklime on sewage sludge, owed most of its action to the lime it contained. Common salt gave good results with oats in a sandy soil not deficient in potash, when used with ammonium sulphate or sodium nitrate, but not with ammonium chloride. A so-called "radioactive catalytic" manure, consisting mainly of potassium silicate and alumina used in conjunction with nitrogen, phosphoric acid and potash, although harmless, never gave any definite beneficial effect. Experiments with oats grown with various manures in powdered Swedish granite, showed that the granite was able to supply the lime and potash requirements but no nitrogen and only very little phosphorus. —W. H. P.

Drilling manures; Results of —— in Hungary. C. Kerpely. Bull. Agric. Intell. and Plant Diseases, 1913, **4**, 1696—1703.

Using a machine which drilled seed and manure, superphosphate applied with the seed had no injurious action on germination either in wet or dry seasons, even when quantities as large as 232 lb. per acre were applied. The corrosive action was only observed when the seeds were not sufficiently dried before sowing. Experiments on barley and oats showed that as much as 93 lb. of sodium nitrate per acre, could be added to the superphosphate without impairing germination. As a rule drilling was much more profitable than broadcasting because of the economy of manure, half the usual quantity being generally sufficient. Manuring in the drill did not, however, produce better results in the second year, but it was not difficult to repeat the application each year, since there was no extra labour. This method of manuring gave special increases in the yield of straw. In the dry season of 1911, the advantage of drilling the superphosphate was specially evident and there appeared to be sufficient moisture both for germination and decomposition of the manure. Manuring in drills had also usually a beneficial effect on the weight per bushel of the grain. With sugarbeets in particular, drilling appeared to have a favourable effect when broadcasting had none, and mixtures of superphosphate, sodium nitrate and 40 per cent. potash salts were applied without harmful effect on germination and with greatly improved yield.—W. H. P.

Electricity [and radioactivity]; Application of —— to agriculture. T. Thorne Baker. J. Roy. Soc. Arts, 1913, **62**, 70—78.

An account of the application of high-tension electric currents to the land by means of overhead wires for the purpose of increasing the yield of crops. It is stated that Lodge-Newman plants have been recently supplied to the Departments of Agriculture of the United States and of Egypt for experimental purposes: for 25—30 acres the capital outlay is £200, but only £300 for an area of double the size. Experimental work has also been done on the effect of radioactivity, the waste material from the manufacture of radium being used, mixed with ordinary soil. Good results have been obtained by mixing 1 part of radioactive material (2 mgrms. Ra per ton) with 10 of soil: with considerably larger quantities the yield was diminished and growth retarded. Some crops were benefited to a much greater degree than others: good results have been obtained with radishes and wheat, but much less marked improvement with cress: in the case of radishes the sugar content also was markedly increased. It is stated that owing to the successful development of the processes of Kent-Smith and Rolfe and of Sommer, comparatively poor residues from carnotite could be treated profitably for the extraction of radium, and that the supply of radium in the near future on a comparatively large scale was assured. The cost of the radioactive treatment of the soil would be about 10s.—15s. per acre. (See also this J., 1913, 1165.)—A. S.

Study of the Pemberton-Kilgore method for determination of phosphoric acid. Hibbard. *See* XXIII.

Patents.

Superphosphate: Method of manufacturing double ——. T. L. Willson and M. M. Haff, Ottawa, Canada. U.S. Pat. 1,078,887, Nov. 18, 1913.

Claim is made for adding pyrophosphoric acid to natural phosphate rock and for the production of "normally dry and set double superphosphates."—F. Sodn.

Phosphates: Apparatus for converting mineral and artificial —— into products soluble in citric acid and suitable for use as fertilisers. Lothringer Portlandzementwerke. Ger. Pat. 266,935, Dec. 20, 1910.

The discharge end of a rotary kiln opens directly into a shaft furnace, the fusion zone of which is in a constricted portion not far below the outlet of the rotary kiln. The material, preheated in the rotary kiln, is melted in the shaft furnace, at temperatures of 1500° C. or higher, by means of blast flames, and the fused material flows down a shoot to a quenching device comprising rollers and water jets.—A. S.

Gas-purifying material ["Cruds d'ammoniaques"]; Treatment of spent —— to render it applicable directly as a fertiliser. E. Bodin, H. Dupont, and M. Riom. Fr. Pat. 460,745, July 25, 1913. Under Int. Conv., Nov. 6, 1912.

The material is ground to a paste with water and then dried at 160°—180° C. in a strong current of air, whereby tarry matters, naphthalene, phenolic compounds, and part of the sulphur are removed, leaving a product containing cyanides, ferro- and ferri-cyanides, thiocyanates and some free sulphur, which can be applied directly as a nitrogenous fertiliser.—A. S.

Peat; Treatment of —— for use as a fertiliser or for other purposes. W. B. Bottomley. Fr. Pat. 460,078, July 5, 1913. Under Int. Conv., July 27, 1912.

See Eng. Pat. 17,487 of 1912; this J., 1913, 878.—**T. F. B.**

XVII.—SUGARS; STARCHES; GUMS.

Diffusion juice; Acidity of ——. H. Pellet. Bull. Assoc. Chim. Sucr., 1913, **31**, 296—300.

Using litmus paper as indicator, the acidity of normal diffusion juice expressed as H_2SO_4, varied from 3 to 7 grms. per hectolitre. At times the juice was approximately neutral and, in one case, a slightly alkaline juice was observed. With phenolphthalein as indicator, the acidities were from 4 to 6 times higher, and in the author's opinion these indications should not be accepted. When beetroots were tried in Egypt some years ago the diffusion juice was always alkaline, notwithstanding the purity of the Nile water. Zamaron also has observed an alkaline beetroot juice in Spain.—L. J. de W.

Reducing sugars; New method for the determination of small amounts of —— in the presence of a large proportion of sucrose. H. Pellet. Bull. Assoc. Chim. Sucr., 1913, **31**, 183—205.

In the usual volumetric or gravimetric determination of small quantities of reducing sugars in presence of a large quantities of sucrose (*e.g.*, in high-grade or refined sugars) by means of Fehling's solution, an appreciable amount of sucrose may be decomposed, leading to the precipitation of an excessive quantity of cuprous oxide. Accurate results may be obtained by using Fehling's solution containing a comparatively small amount of sodium hydroxide and heating at about 60° C. *Fehling's solution* (10 c.c. = 0·05 grm. of invert sugar): (a) 34·64 grms. of crystallised copper sulphate per 500 c.c.; (b) 180 grms. of Rochelle salt and 60 grms. of sodium hydroxide per 500 c.c.; equal volumes of the two solutions are mixed together just before use. *Standard solution of invert sugar* (1 c.c. = 0·005 grm. of invert sugar): 20 c.c. of the Fehling's solution, 20 c.c. of the sugar solution to be tested (containing less than 0·10 grm. of reducing sugars), and 10 c.c. of water, are heated to 60°—62° C. for 10 minutes, and the precipitated cuprous oxide determined, preferably by adding 50 c.c. of cold water, filtering twice through a small filter previously moistened with hot water, calcining the precipitate in a muffle furnace (not over a gas burner or alcohol lamp), and weighing as cupric oxide. The conversion factor (usually 0·453) is determined by a control test with the standard invert sugar solution, and the weight of copper retained by the paper is also ascertained and deducted. For rapid work the cuprous oxide may be collected on a disc of filter paper of definite size, and the depth of colour estimated by comparison with a series of papers prepared with increasing amounts of the standard invert sugar solution under similar conditions.—J. P. O.

Reducing sugars; Action of alkali carbonates on ——, under the influence of heat. H. Pellet. Bull. Assoc. Chim. Sucr., 1913, 31, 317—322.

The alkalinity of juice after the second carbonatation, as well as after sulphitation, is almost entirely due to carbonates, and it was found that sodium carbonate like caustic alkalis caused the destruction of reducing sugar with production of a brown colour and loss of alkalinity on concentrating the solution. A solution alkaline to phenolphthalein but neutral to litmus was found to be still capable of acting destructively on reducing sugars.
—L. J. de W.

Betaine; Decomposition of —— by caustic potash. Preparation of hydrocyanic acid by the destructive distillation of beet molasses by the Dessau process. F. Albers. Chem.-Zeit., 1913, **37**, 1533—1534, 1545—1547.

The production of hydrogen cyanide by the Dessau process (see Eng. Pat. 7171 of 1895, this J., 1896, 114; H. Ost, Z. angew. Chem., 1906, 609) is based on the interaction at high temperatures of ammonia and methylamines evolved in the destructive distillation of waste beet molasses (see Voerkelius, this J., 1909, 1122). In view of the high proportion (about 15 per cent.) of betaine in waste molasses, the author has studied the formation of amines from this compound on heating with caustic potash, waste molasses being alkaline in reaction. When heated to 200°—220° C. in presence of potassium hydroxide, betaine yields about ⅓ of its nitrogen in the form of trimethylamine, the only volatile product formed besides carbon dioxide. The residue contains a compound which forms a hydrochloride, $C_4H_9O_2N,HCl$, melting at 187°—189° C., and a platinichloride, $(C_4H_9O_2N,HCl)_2PtCl_4$. The yield of this compound (weighed as hydrochloride) is 50—60 per cent. of the betaine. At 300°—315° C. the new compound evolves the whole of its nitrogen as monomethylamine. When a solution containing betaine and potassium hydroxide is introduced drop by drop into a retort heated to 500°—540° C., the betaine is decomposed entirely into volatile products with the exception of some carbon dioxide fixed by the alkali. Trimethylamine is formed (in relatively smaller amounts than at 220° C.) together with monomethylamine and ammonia, the last being produced by decomposition of the two amines. These three bases together contain about 85 per cent. of the nitrogen of the betaine. Part of the remaining 15 per cent. is probably free nitrogen produced by dissociation of the amines and ammonia, and is not available for the production of hydrogen cyanide. A much larger proportion of elementary nitrogen must be produced at the higher temperatures employed in the Dessau process. Besides nitrogenous products, betaine yields at 500°—540° C. considerable quantities of hydrogen and methane and some carbon monoxide and dioxide. The amines interact with hydrogen to some extent at this temperature, and give rise to ammonia and methane.
—J. H. L.

Fucitol. E. Votocek and R. Potmesil. Ber., 1913, **46**, 3653—3655.

Fucose was prepared by Tollen's method (this J., 1900, 160) from the sea-weed, *Fucus vesiculosus* (yield 33 grms. from 10 kilos. as compared with 3—3½ grms. obtained by Tollens and Widtsoe from 4 kilos. of *Fucus serratus*), and was then reduced by means of sodium amalgam, yielding an alcohol, *fucitol*, $C_6H_{14}O_5$, m.pt., 153°—154° C., which was the optical antipode of rhodeitol (this J., 1906, 549). In presence of borax in aqueous solution its rotatory power was $[\alpha]^{20}_{D}=+4{\cdot}7$, and when mixed with an equivalent quantity of rhodeitol in hot alcoholic solution, it yielded racemic fucitol (*d,l*-rhodeitol), m.pt. 168°—170° C.—A. S.

Preserving meat and other food products [by means of sugar]. Vasseux. *See* XIXa.

Patents.

[*Sugar.*] *Defecator.* M. B. Cresswell, Des Moines, Iowa. U.S. Pat. 1,075,629, Oct. 14, 1913.

A tank is divided by a partition into a boiling compartment and a "dead-chamber." The former is fitted with a heating system consisting of a steam coil connected by a valved pipe with a perforated tube. The jets of steam from the perforated tube force the syrup or juice from the inlet end of the boiling compartment to the further end and through an opening in the partition into the "dead-chamber," where it encounters an inclined baffle-plate. The heavier impurities are deposited in a pocket in the boiling compartment and at the bottom of the "dead-chamber," whilst the scum is scraped from the surface of the syrup at the baffle-plate. The syrup returns as an under-current from the "dead-chamber" to the boiling compartment. When the current of juice has been started, the supply of steam to the perforated tube is cut off. The apparatus renders unnecessary the use of defecating agents, such as clay, infusorial earth, or lime.
—L. E.

[*Sugar.*] *Evaporator; Finishing* ——. M. B. Cresswell, Des Moines, Iowa. U.S. Pat. 1,075,630, Oct. 14, 1913.

The apparatus comprises a boiling tank containing a steam coil, and a contiguous skimming tank the bottom of which is at a higher level than that of the boiling tank. An opening in the wall common to the two tanks extends to the bottom of the skimming tank and the latter contains an inclined baffle-plate. Partially refined syrup, such as that described in U.S. Pat. 1,075,629 (see preceding abstract) is admitted to the boiling tank and preferably to the level of the bottom of the skimming tank. On being heated, the syrup expands and part flows into the skimming tank, carrying the scum with it. The scum is scraped over the baffle-plate to a drain, and the cooled syrup returns as an undercurrent to the boiling tank, a transverse bar near the bottom of the opening serving to hold back any floating scum.—L. E

Sugar; Apparatus for washing —— in centrifugal machines. Sugar Centrifugal Discharger Co. Fr. Pat. 460,234, July 10, 1913.

A fan-shaped spray of water is ejected, from a perforated nozzle, against the sugar at the rotating wall of the centrifuge. A regulating device arrests the discharge of water after a predetermined period. An automatic oscillatory motion is imparted to the perforated nozzle in order to distribute the separate jets uniformly over the wall of sugar. The angular adjustment of the nozzle can be altered so as to adapt the vertical dimensions of the spray at the wall of the centrifuge to the height of the sugar. The volume of water ejected can be regulated by closing some of the perforations by means of an adjustable plate.
—J. H. L.

Molasses, Process for the desaccharification of —— and the boiling of syrups. A. Gräntzdörffer and A. List. Fr. Pat. 460,192, July 9, 1913.

In the boiling of syrups a mixture of molasses with a solution of sugar is added after the formation of grain, and the boiling is then continued in the ordinary way. It is claimed that the quality of the sugar is improved and that the added molasses is partially desaccharified.—J. H. L.

Starchy materials; Apparatus for washing disintegrated ——. W. H. Uhland Ges. m. b. H. Ger. Pat. 267,199, June 29, 1911.

The starchy material is introduced into a perforated trough mounted above a collecting trough. Brushes fixed to rotating arms engage the inner side of the perforated trough and lift the material and bring it under jets through which the washing water is delivered. The collecting trough is divided into compartments. Water is delivered to the jet above the first compartment, from which the washed material is withdrawn, but the jets above the other compartments are supplied with washing water withdrawn from tho preceding compartments.—A. S.

Fermentable sugars ; Process for producing ——. Standard Alcohol Co. Fr. Pat. 460,084, July 7, 1913. Under Int. Conv., July 15, 1912.

See U.S. Pat. 1,056,161 of 1913 ; this J., 1913, 441.—T.F.B.

Sugars from cellulose ; Process for producing ——. Standard Alcohol Co. Fr. Pat. 460,085, July 7, 1913. Under Int. Conv., July 15, 1912.

See U.S. Pat. 1,056,162 of 1913 ; this J., 1913, 441.—T. F. B.

Fermentable sugars ; Process for producing ——. Standard Alcohol Co. Fr. Pat. 460,086, July 7, 1913. Under Int. Conv., July 15, 1912.

See U.S. Pat. 1,056,163 of 1913 ; this J., 1913, 441.—T. F. B.

Apparatus for dissolving sugar and other substances. Ger. Pat. 266,335. *See* I.

Application of the waste from sugar refineries to the manufacture of artificial Portland cement. Fr. Pat. 460,438. *See* IX.

XVIII.—FERMENTATION INDUSTRIES.

Maltase of beer yeast ; Conditions of activity of the ——. *II. Action of maltase on α-methylglucoside, and the affinity-constant of the enzyme.* P. Rona and L. Michaelis. Biochem. Zeits., 1913, **58** 148—157. (See also this J., 1913, 1123.)

The enzyme of bottom fermentation yeast which hydrolyses α-methylglucoside, exerts its maximum activity in solutions of almost, if not quite, the same ionic concentration (p_H lies between 5·8 and 6·6) as the optimum already found for the hydrolysis of maltose (*loc. cit.*). The affinity-constant of the enzyme with respect to α-methylglucoside is 11·1, a value appreciably lower than that (*viz.*, 60) found for invertase with respect to sucrose (see Michaelis and Menten, this J., 1913, 442).—J. H. L.

Yeast fermentation without sugar. XIII. Formation of aldehyde during the fermentation of hexoses and the so-called auto-fermentation. C. Neuberg and J. Kerb. Biochem. Zeits., 1913, **58**, 158—170. (See also this J. 1912, 893 ; 1913, 102, 620, 803.)

The quantity of acetaldehyde produced by alcoholic fermentation, even in presence of zinc chloride (see Kostytschew, this J., 1912, 553, 741 ; 1913, 207) amounts to only 0·05—0·2 per cent. of the sugar fermented, and does not justify the theory that the whole of the alcohol is formed by reduction of aldehyde. There is no proof that the small quantities of aldehyde found are derived solely from decomposed sugar. The experiments of Kostytschew on the reduction of aldehyde to alcohol by yeast are inexact owing to errors of method, such as the use of sodium bisulphite for the separation of aldehyde from alcohol. Aldehyde can be accurately titrated in presence of alcohol by Ripper's method (see this J., 1901, 288), and the alcohol can be determined by the method of Nicloux (see this J., 1897, 473, 566).—J. H. L.

Alcoholic fermentation ; Influence of mercury on ——. P. Nottin. Comptes rend., 1913, **157**, 1005—1008.

Contact of mercury with fermenting wort retards fermentation but increases the yeast crop produced. The former effect is due to the formation of minute quantities of mercury salts, and the latter to a physical action of the metal in preventing supersaturation of the liquid by carbon dioxide as the result of which reproduction of the yeast proceeds more freely.—J. H. L.

Hop bitter substances ; Determination of —— *by cold extraction with carbon tetrachloride.* R. Seibriger. Woch. Brau., 1913, **30**, 610.

The minced hops are treated with carbon tetrachloride as previously described (this J., 1913, 442), save that extraction is continued for 2½ hours to insure complete solution of the bitter substances in the case of moist hops The titration is effected with phenolphthalein as indicator. The first portion (3—4 grms.) of the minced hops from the mincing machine is used for determining the moisture by drying for 3 hours at 105° C. A portion of the bulk of the minced material is also used for a moisture determination, the value found being employed in calculating the percentage of bitter substances referred to the dry hops. —L. E.

Sulphurous anhydride in wines ; Determination of the total ——. L. Lévy. Ann. Falsif., 1913, **6**, 595.

A mixture of 50 c.c. of the wine and 2 grms. of barium dioxide is allowed to stand overnight in a stoppered, conical flask of about 150 c.c. capacity, then treated with hydrochloric acid until no more gas is evolved, and then with ammonium chloride. After heating to boiling, the precipitate is filtered off, washed with a dilute solution of ammonium chloride, dried and ignited. The difference between the weight of this precipitate and that of the barium sulphate corresponding to the sulphuric acid originally present in 50 c.c. of the wine, multiplied by 0·25, represents the amount of sulphurous anhydride in 50 c.c. —L. E.

Biochemical synthesis of glucosides of polyhydric alcohols ; α-glucosides of glycerol and glycol. Bourquelot and Bridel. *See* XX.

Colouring matter suitable for alimentary and other products. Fr. Pat. 460,441. *See* IV.

XIXa.—FOODS.

Benzoic acid ; Detection and determination of —— *in milk and cream.* E. Hinks. Analyst, 1913, **38**, 555—558.

Qualitative. 25 c.c. of milk, or 10—20 grms. of cream, are heated with an equal volume of concentrated hydrochloric acid, as in the Werner-Schmidt method for the estimation of fat, until the precipitated curd is completely dissolved. The mixture is cooled and shaken with 25 c.c. of a mixture of methylated ether (1 vol.) and petroleum spirit (2 vols.). The ethereal solution is separated, 1 drop of ammonia solution added, then 5 c.c. of water. The mixture is shaken, the aqueous layer separated, heated for a few minutes on the water-bath to expel excess of ammonia and tested for benzoic acid with ferric chloride in the usual manner.

Quantitative. The same quantities of milk or cream and acid as above, are heated under a reflux condenser. The mixture is cooled and extracted three times with

20 c.c. of a mixture of equal volumes of ether and petroleum spirit. The ethereal extracts are made alkaline with ammonia solution, 10 c.c. of water added, and the mixture shaken; the aqueous layer is separated, and the alkaline extraction is repeated twice. The bulked aqueous extracts are acidified with hydrochloric acid and extracted 3 times with mixed ether and petroleum spirit as before. These final extracts are allowed to evaporate spontaneously, and the residue dried to constant weight (24 hrs.) in a desiccator. The benzoic acid is then volatilised by heating at 100° C. (an hour or two) the loss in weight representing the amount present. The method gives a close approximation to accuracy in the second place of decimals. The presence of boric acid does not interfere with the method, which has also been applied to butter. Butter may be treated direct as in the case of cream, or the aqueous portion may be separated, the fat shaken several times with hot sodium bicarbonate solution, and the mixed washings and aqueous portions digested with hydrochloric acid.—E. W. L.

Preserving meat and other food products ; Practical and economical method of—— [by means of sugar]. A. Vasseux. Bull. Assoc. Chim. Sucr., 1913, **31**, 180—182.

Good results have been obtained by the author in the preservation of meat by covering with powdered sugar. During the first few days of the treatment, water is absorbed by the sugar; the resulting syrup is drawn off and re-crystallized. When the syrup has drained away, the meat is again sprinkled with powdered sugar, after which it may be preserved indefinitely with, it is stated, no alteration in quality. Fish may be treated in the same manner.—J. P. O.

Lard ; Detection of beef and mutton fats in ——. A. Bömer. Z. Unters. Nahr. Genussm., 1913, **26**, 559—618.

The method is based upon the differences in the m. pts. of the characteristic glycerides of lard and of beef and mutton fats as compared with the m. pts. of the respective fatty acids. The difference between the m. pt. of α-palmito-distearin from lard and its separated fatty acids is 5·2° C., whilst in the case of the β-palmito-distearin of beef and mutton fats the difference is only 0·1° C. Fifty grms. of the melted lard are dissolved in 50 c.c. of ether and crystallised at about 15° C. The crystals are pressed between filter paper, recrystallised from 50 c.c. of ether and again dried with filter paper. In the case of pure lards the glycerides thus obtained usually melt at 63° to 64° C., whilst those from lards containing beef fat, etc. have usually a lower m. pt. Should the m. pt. be below 61° C. the recrystallisation must be repeated until the m. pt. is above 61° C. In the case of soft oily lards a mixture of 3 to 4 parts of ether with 1 part of alcohol or anhydrous acetone is useful for the first crystallisation. The fatty acids are separated from part of the deposit, and the m. pts. of the glycerides and fatty acids simultaneously determined. In the case of glycerides melting between 61° and 65° C. a lard must be regarded as adulterated with beef or mutton fat or with hydrogenated oil when the m. pt. of the glycerides added to twice the difference between the m. pts. of the glycerides and their fatty acids is lower than 71° C. With glycerides melting between 60° and 61° C. the presence of foreign fat is certain when the difference between the m. pts. is less than 5° C. and with glycerides melting from 65° to 68·5° C. when the difference is less than 3° C. For the detection of hardened (hydrogenated) oils the method may be used in conjunction with the phytosteryl acetate test.—C. A. M.

Coffee ; Investigations on ——. T. Rözsenyi. Chem.-Zeit., 1913, **37**, 1482—1484.

To determine the proportion of adulterant (cereals) added to ground coffee, advantage may be taken of the fact that coffee ash is strongly alkaline whereas that of cereals is almost neutral. The alkalinity of the ash from five samples (Portorico, Mocca, Ceylon, Santos, Domingo) closely averaged 50 c.c. of N/1-acid per 100 grms. of roasted coffee, that of various substitutes under the same conditions, about 1 c.c. The ash in the five samples amounted to between 4·06 and 4·80 per cent. Artificial mixtures gave the following alkalinities :—

50%	Mocca	+	50%	barley	:	24·5 c.c.
75%	,,	+	25%	malt	:	37·6 ,,
50%	,,	+	50%	rye	:	25·0 ,,
20%	Ceyloa	+	80%	barley	:	8·5 ,,
10%	Santos	+	90%	,,	:	4·9 ,,

The unground roasted beans can be extracted fairly well with water for the manufacture of coffee extract, and the exhausted beans dried, glazed, and sold for fresh coffee. In this treatment the coffee loses 10 per cent. in weight and 40 per cent. of its ash, and the adulteration is detected by the determination of the latter.—W. R. S.

Chicory ; Detection of —— in decoctions of chicory and coffee. C. H. La Wall and L. Forman. Amer. J. Pharm., 1913, **85**, 535—538.

The determination of the cupric-reducing power affords a means of detecting the presence of chicory in coffee (see Tatlock and Thomson; this J., 1910, 138). The extractives of roasted coffee contain from 1·92 to 2·64 per cent. of reducing sugars whilst the extractives of roasted chicory contain from 25·2 to 27·7 per cent. Therefore, when the extractives of a coffee decoction yield more than 3 per cent. of their weight of reducing sugars the presence of chicory is indicated. The addition of cane sugar to the coffee does not affect the results and its presence may be detected by a polarimetric examination.—W. P. S.

Patents.

Milk ; Sterilisation of ——. A. Shelmerdine, Liverpool. Eng. Pat. 26,743, Nov. 21, 1912.

The milk is passed at a temperature of 50°—65° C. through a glass tube of $\frac{3}{4}$—1 in. diam., and during its passage is subjected to the action of an alternating current of about 1·5 kilowatts and 3000 volts. The electrodes are placed at distances of from 12 to 20 in. on enlarged parts of the tube. The milk passes under the edge of each electrode and taps or plugs are provided for emptying the enlarged parts, when required. Modified forms of the apparatus are also described.—W. P. S.

Fruit ; Process of preserving uncooked ——. W. P. Thompson, Liverpool. From R. Oliver, Marseilles. Eng. Pat. 5999, Mar. 11, 1913.

The fruit is immersed in a solution containing about 1 kilo. of crystallised sodium bisulphite per 100 litres of water; 3 kilos. of sodium chloride may also be added. If it is desired to preserve the fruit for more than 1 year, it is, after this period, immersed in a 1 per cent. solution of sulphur dioxide. For apricots and peaches, a dilute solution of calcium sulphite may be employed.—W. P. S.

Coffee extract ; Process of making ——. J. T. Davis, Assignor to Davis Oil Refining Co., San Francisco, Cal. U.S. Pat. 1,079,474, Nov. 25, 1913.

Ground roasted coffee is extracted with water at a temperature not exceeding 170° F. (76° C.) and the extract is evaporated below 170° F. and under reduced pressure. —W. P. S.

Milk ; Process and apparatus for sterilising ——. A. Shelmerdine. Fr. Pat. 460,315, June 13, 1913. Under Int. Conv., Nov. 21, 1912.

See Eng. Pat. 26,743 of 1912; preceding.—T. F. B.

Flour ; Process for ageing and bleaching ——. J. A. Wesener. Fr. Pat. 460,776, July 26, 1913.

See U.S. Pat. 1,071,977 of 1913; this J., 1913, 957.—T. F. B.

Coffee extract ; Process for producing a ——. K. von Vietinghoff. Fr. Pat. 460,949, July 8, 1913.

See Eng. Pat. 10,262 of 1913; this J., 1913, 804.—T. F. B.

Cereal coffee or coffee substitutes and process for making them. J. H. Kellogg. Fr. Pat. 460,978, July 31, 1913.

See U.S. Pats. 1,069,265, 1,069,266, 1,069,267, and 1,069,268 of 1913; this J., 1913, 880.—T. F. B.

Colouring matter suitable for alimentary and other products. Fr. Pat. 460,441. *See* IV.

XIXb.—WATER PURIFICATION; SANITATION.

Oxygen in water; Winkler's method for the determination of ——; the effect of nitrite and its prevention. F. E. Hale and T. W. Melia. J. Ind. Eng. Chem., 1913, **5**, 976—980.

Winkler's method (this J., 1889, 727) gave sufficiently accurate results in presence of such quantities of nitrite as are ordinarily present in waters. The disturbing effect of larger quantities of nitrite was satisfactorily counteracted by the addition of sodium acetate crystals or a strong solution of potassium acetate to neutralise the hydrochloric acid before exposing the solution to the air.—A. S.

Patents.

Artificial zeolites and other compounds used for softening water; Apparatus for cleansing or revivifying —— and for other like chemical treatments. F. R. Webb, Randalstown, Ireland. Eng. Pat. 27,415, Nov. 28, 1912.

The supply of water is cut off from the chamber containing the bed of artificial zeolites and, when the level of the water has sunk to the upper surface of the bed, the outlet is also closed. A 10 per cent. solution of sodium chloride is then admitted and after passing slowly through the bed of zeolites, is discharged through a pipe fitted with a valve controlled by a rocking lever; one arm of this lever is hollow and through it the liquid passes into a ball provided with an adjustable orifice. When the level of liquid in the chamber sinks to the surface of the zeolite bed this ball empties, the arm tilts, and a valve on the water supply pipe is opened so that the chamber is filled to a definite level. The ball then fills, the lever falls over and the chamber is emptied, whilst the water supply is cut off. These operations are repeated. The lever also operates a ratchet wheel, so that after the reagent has been removed by the alternate filling and emptying of the chamber, the lever arm becomes fixed and water is allowed to flow through the bed until the latter is completely cleaned. —W. P. S.

Filtering with sand or gravel; Vessel for —— designed for the purification of residuary waters charged with fatty materials or natural waters charged with iron salt in solution. Puech, Chabal et Cie., Paris. Eng. Pat. 9746, April 25, 1913. Under Int. Conv., Nov. 19, 1912.

Two series of perforated pipes are arranged in the filtering vessel, one below and the other above the layer of sand or gravel. Air is forced periodically through the lower pipes in order to cleanse the filtering material, whilst a continuous supply of air under pressure is introduced into the water through the upper pipes so that fatty substances are carried to the surface and prevented from coming into contact with the sand or gravel.—W. P. S.

Sewage and the like; Apparatus for purifying ——. P. Bunzel, Cöthen, Germany. U.S. Pat. 1,079,391, Nov. 25, 1913.

A number of settling tanks communicate through horizontal sliding valves with sludge conduits below. The latter are fitted with removable ends for discharging the sludge; the water separated from the sludge collects in a transverse channel. Means are provided for supplying water to the conduits after the sludge has been discharged, and the end covers are replaced before the valves are reopened.—W. P. S.

Sewage disposal. L. T. Leet, Reading, Pa., Assignor to Water and Sewage Purification Co., New York. U.S. Pat. 1,079,569, Nov. 25, 1913.

Sewage is separated into two portions, one liquid and the other containing a high percentage of solids; the latter portion is conducted to a closed septic tank where it undergoes liquefaction. The effluent from the septic tank is mixed with the liquid portion of the sewage, and the mixture is subjected to an oxidising treatment.—W. P. S.

Clarification of effluents; Process for the ——. F. Wellensiek. Ger. Pat. 266,998, Jan. 18, 1913.

The effluent is treated first with an alkaline solution of the humic substances separated from the waste lyes from the manufacture of cellulose from straw or wood, and then with basic or acid salts or other precipitants, *e.g.*, milk of lime or aluminium sulphate.—A. S.

Combustible matter; Extracting or sorting —— from refuse. G. Hidoux and J. Bernheim, Paris. Eng. Pat. 6998, March 22, 1913.

After separating any very large pieces, the refuse is passed through a pair of crushing rolls and then over a vibrating sieve, the distance between the wires of the sieve being twice that between the rolls. It is stated that the combustible material is only flattened out by the rolls and remains on the sieve whilst the incombustible material is crushed and passes through. Several pairs of rolls and sieves are used in succession, each succeeding pair of rolls being set closer together and each succeeding sieve having smaller meshes.—W. H. C.

Liquids; Apparatus for sterilising ——. J. S. Forbes, Philadelphia, U.S.A. Eng. Pat. 9976, April 28, 1913.

Three cylindrical vessels are arranged one within the other, with narrow intervening spaces; the upper edges of the vessels are flanged and fit one over the other, the innermost vessel being the tallest. The outer vessel is provided with a central tube extending through the bottom and central tubes in the other vessels fit over the first tube. The liquid is delivered from a constant level device into a funnel which conducts it into the space between the central tubes of the inner vessels; it then passes through the space between the walls of these vessels to a heater, overflows from the latter and is conducted to the space between the outer vessel and the next inner one, finally passing up the inner central space and escaping through the central tube.—W. P. S.

Liquids; Method of purifying and sterilising ——. G. W. Swinburne, East Orange, N.J., Assignor to Sterilisation Co. U.S. Pat. 1,079,377, Nov. 25, 1913.

Sewage or other liquid containing a chloride is passed through an electrolysing apparatus and is then allowed to remain at rest until the products of the electrolysis have acted on the liquid.—W. P. S.

Liquids; Apparatus for sterilising —— by means of ultraviolet rays. O. Linker, Leipzig, Germany. U.S. Pat. 1,079,503, Nov. 25, 1913.

The tube conveying the liquid to be sterilised passes through a central passage extending throughout the length of a mercury-vapour lamp; one end of the tube is then turned backwards in the form of a spiral round the outer wall of the lamp. The tube is out of contact with the walls of the lamp and is sealed into each end of the passage so that a dead-air space is provided between the inner wall of the lamp and the tube.—W. P. S.

Preparing nitrous compounds from mixtures of petroleum and tar. Fr. Pat. 460,280. *See* IIa.

XX.—ORGANIC PRODUCTS ; MEDICINAL SUBSTANCES ; ESSENTIAL OILS.

Belladonna plants ; Individual variation in the alkaloidal content of ——. A. F. Sievers. J. Agric. Research, 1913, **1**, 129—146.

So far as the percentage of alkaloids present in belladonna leaves and the quantity of material available were concerned, the best time for picking the leaves was from the period of flowering till the early berries began to ripen. There appeared to be no relation between the appearance of the plant and the alkaloidal content of the leaves. The variation of the percentage of alkaloids in the leaves of different plants was very large. A number of plants with leaves rich in alkaloids in one season were found to have equally good leaves in the following season. The same held with regard to plants with leaves of a low alkaloidal content.—F. Shdn.

Strychnine ; Some non-acid oxidation products of ——. H. Leuchs and G. Schwaebel. Ber., 1913, **46**, 3693—3699.

Solid permanganate and a solution of strychnine in chloroform were added slowly to a large volume of acetone at 15°—20° C. The sludge was treated with a solution of ammonium chloride. The ammoniacal aqueous liquor was separated, acidified and extracted with chloroform. The acid oxidation products were removed by means of a solution of potassium bicarbonate. The chloroform on evaporation left a resinous residue, which after prolonged boiling with benzene became powdery. This was crystallised from alcohol, from which it separated in clear domed prisms, $C_{19}H_{18}O_4N_2$, which melted with decomposition at 320° C. The benzene solution was treated with light petroleum and the precipitate dissolved in hydrochloric acid and mixed with methyl alcohol. On recrystallisation from alcohol it had the composition, $C_{18}H_{19}O_3N_2Cl,H_2O$, and melted at 296°—300° C. with decomposition. The corresponding base appeared to be readily soluble in water. The manganese dioxide sludge was also treated with sulphur dioxide in the presence of chloroform. After removal of the acids by means of potassium bicarbonate, a crystalline product was isolated from the chloroform. This crystallised from alcohol in light yellow leaflets having the composition, $C_{21}H_{22}O_5N_2$, and melting with decomposition at 252°—255° C. All the above substances had a bitter taste and gave the characteristic strychnine reaction with chromic acid.
—F. Shdn.

Physostigmine. I. F. Straus. Annalen, 1913, **401**, 350—376. (See also this J., 1912, 509.)

The gold salt of physostigmine melted with decomposition at 163°—165° C., and the platinum salt at 150° C. Eseroline benzoate crystallised from ether in characteristic rosettes, m.pt. 155°—156° C. Eseroline was obtained by the distillation of physostigmine in a high vacuum. Eseroline methiodide was converted by a special method into the ammonium base, which was heated to above 200° C. in a vacuum. A solid distilled over which was purified by crystallising from ether. The substance, which was styled *physostigmol*, had the composition, $C_{11}H_{11}ON$, and melted at 107·5—108° C. It was phenolic in character and contained one methyl grouping attached to the nitrogen atom. During the distillation of the above ammonium base tri- and dimethylamine were produced.
—F. Shdn.

Glucosides of polyhydric alcohols ; Biochemical synthesis of —— *; a-glucosides of glycerol and glycol.* E. Bourquelot and M. Bridel. Comptes rend., 1913, **157**, 1024—1027.

When aqueous solutions containing dextrose together with glycerol or glycol are treated with α-glucosidase (see this J., 1913, 251, 762), synthesis of α-glycerylglucosides and α-glycylglucosides slowly takes place. The higher the concentration of glycerol or glycol, *cæteris paribus*, the longer is the time required for the attainment of equilibrium in the solution, and the greater is the quantity of glucosides produced. The activity of α-glucosidase is destroyed by 30 per cent. aqueous solutions of monohydric alcohols (*loc. cit.*) and by 60 per cent. solutions of glycol, whilst glycerol has no injurious action even at a concentration of 90 per cent.—J. H. L.

Essential oils , Constituents of ——. *Calamus oil.* F. W. Semmler and K. E. Spornitz. Ber., 1913, **46**, 3700—3707.

A small sample of calamus oil with the following characters, b. pt. 55°—170° C. at 12·5 mm., sp. gr. 0·9569 at 20° C., $n_D=1{\cdot}5070$, $\alpha_D=+20°$, was fractionated. A fraction was separated boiling between 150°—160° C. at 13 mm., which gave an acetate, $C_{17}H_{28}O_2$, with the characters, b. pt. 155°—163° C. at 12 mm., sp. gr. 0·9727 at 17° C., $n_D=1{\cdot}51004$ and $\alpha_D=+4°$. In a larger quantity of Russian calamus oil, pinene, camphene and camphor were detected. The bicyclic sesquiterpene, calamene (a naphthalene derivative), was also separated and purified. Its characters were : b. pt. 123°—126° C. at 10·5 mm., sp. gr. 0·9224 at 20°/19° C., $\alpha_D=+5°$, $n_D=1{\cdot}50572$. When reduced with hydrogen in the presence of platinum, an optically inactive hydrocarbon, $C_{15}H_{28}$, was produced which boiled at 123°—125° C. at 10 mm. A higher fraction of the oil had the characters : b. pt. 150°—160° C. at 13 mm., sp. gr. 0·96115 at 28° C., $n_D=1{\cdot}5098$, and appeared to be a sesquiterpene alcohol, $C_{15}H_{24}O$, which could not be esterified owing to the readiness with which water split off, with formation of a hydrocarbon $C_{15}H_{22}$, the characters of which were : b. pt. 136°—143° C. at 15 mm., sp. gr. 0·9324 at 20°/19° C., $n_D=1{\cdot}52317$, $\alpha_D=+6°$.
—F. Shdn.

Citronella oil ; Transformation of —— *into rose oil.* P. Barbier and R. Locquin. Comptes rend., 1913, **157**, 1114—1118.

The researches of Barbier and Bouveault and of Barbier and Léser (this J., 1896, 469 ; 1900, 769) showed that *l*-rhodinol (the alcohol of pelargonium and French rose oils) and *d*-citronellol are stereoisomerides of the formulæ : $CH_2:C(CH_3).(CH_2)_3.CH(CH_3).CH_2.CH_2OH$ and $(CH_3)_2C:CH.(CH_2)_2.CH(CH_3).CH_2.CH_2OH$ respectively. In spite of this, it is still widely held, especially in Germany, that *l* rhodinol and *d*-citronellol are optical antipodes. It is now shown that it is possible to obtain rhodinol from citronellol or citronellal, and that the product has similar properties to those of natural rhodinol, including a pronounced odour of fresh roses, except that it is dextrorotatory to the same degree as *l*-citronellol is lævo-rotatory. The following methods of transformation were used :—The acetic ester of citronellol was converted into the acetobromo-hydrin by treatment with hydrobromic acid in acetic acid solution, and the product was saponified. Citronellal (from citronella oil) was converted into citronellic acid by way of the oxime and nitrile, the acid was treated with thionyl chloride in benzene solution, the product poured into alcohol, the resulting hydrochloride of ethyl citronellate (rhodinate) treated with sodium acetate and acetic acid, and the product reduced with sodium and alcohol. Citronellol was hydrated by means of 30 per cent. sulphuric acid, and the resulting 3.7-dimethyloctanediol-1.7, $(CH_3)_2:C(OH).(CH_2)_3.CH(CH_3).CH_2.CH_2OH$, dehydrated by heating with 5 per cent. sulphuric acid, and the product rectified. The results described afford an explanation of the facts that the same derivatives are frequently obtained starting from *d*-citronellol or *l*-rhodinol respectively and also of the more or less pronounced odour of rhodinol frequently observed in commercial citronellol. All three rhodinols are now known : *l*-rhodinol occurring in pelargonium and rose oils, *d*-rhodinol obtained as described above from *d*-citronellal (the principal constituent of citronella oil), and *i*-rhodinol prepared by Bouveault and Gourmand (this J., 1904, 759) by reduction of synthetic ethyl rhodinate. (See also this J., 1896, 292, 373 ; 1897, 823 ; 1898, 267, 486.)—A. S.

Olibanum oil; Constituents of——. E. Fromm and E. Autin. Annalen, 1913, **401**, 253—262.

A quantity of "terpene-free" olibanum oil with the characters: b. pt. 70° C. at 12 mm., sp. gr. 0·9685 at 15° C., $\alpha_D=+20°\,48'$, was fractionated by distillation. Two main fractions were separated boiling at 210°—211° C. and 200° C. respectively. The former fraction had the composition $C_{10}H_{16}O$ and consisted principally of a compound styled *olilanol* which resembled a mixture of a ketone and an alcohol in its behaviour. When oxidised by means of cold neutral permanganate solution, *d*-borneol and an acid were produced. The latter when purified had the composition $C_9H_{14}O_3$, and melted at 130° C. after crystallising from water. It appeared to be identical with the pinononic acid obtained by Kerschbaum (Ber., 1900, **33**, 891) by the oxidation of verbenone. A small amount of a volatile acid, $C_{10}H_{16}O_4$, was also formed during the oxidation.—F. Shdn.

Douglas fir leaf oil. A. W. Schorger. J. Amer. Chem. Soc., 1913, **35**, 1895—1897.

Six samples of leaves of the Douglas fir (*Pseudotsuga taxifolia*, Britt.) distilled in California yielded from 0·11 to 0·20 per cent. of oil, average 0·163 per cent. The oils gave the following figures: sp. gr. at 15° C., 0·8727—0·8759; $n_D=1{\cdot}4758$—$1{\cdot}4780$; $\alpha^{20}_D=-17{\cdot}02°$ to $-22{\cdot}17°$; acid value 0·65—1·10; ester value 11·13—24·25; ester value after acetylation 27·50—51·78. The oil consisted principally of *l*-α pinene 25 per cent. and *l*-β pinene 48 per cent., with about 6 per cent. each of borneol, bornyl acetate, and *i*- or *l*-limonene; together with furfural and other unidentified constituents.—R. G. P.

Camphor dissolved in 90 per cent. alcohol; Specific optical rotatory power of——. H. Malosse. J. Pharm. Chim., 1913, **8**. 505—506.

Observations were made of the optical rotation of camphor dissolved in 90 per cent. alcohol at 20° C., the strength of the solution varying between 3 and 37 per cent. The results led to the following formulæ, where *c* represents grms. of camphor in 100 c.c. of solution, *p* the percentage of camphor and *q* the percentage of solvent in the solution:

$$[\alpha]^{20}_D=38{\cdot}7+0{\cdot}1532c$$
$$[\alpha]^{20}_D=38{\cdot}7+0{\cdot}1344p$$
$$[\alpha]^{20}_D=52{\cdot}14-0{\cdot}1344q$$

—F. Shdn.

Ferro- and ferricyanide salts of betaine. [*Isolation of betaine from molasses residues.*] G. Roeder. Ber., 1913, **46**, 3724—3727.

On mixing concentrated aqueous solutions of betaine hydrochloride and potassium ferro- or ferricyanide, the corresponding betaine salts were precipitated. The salts were very slightly soluble in alcohol, and decomposed with the formation of hydrogen cyanide when boiled with water. The composition altered when they were washed with methyl alcohol and ether. Betaine ferrocyanide, $FeC_6N_6H_4,4C_5H_{11}O_2N,2H_2O$, was a white powder, whilst the ferricyanide $FeC_4N_6H_3,3C_5H_{11}O_2N,2H_2O$, formed canary yellow leaflets with jagged edges. The latter salt could be crystallised from water. The formation of these salts was used to isolate betaine hydrochloride from residues of molasses. The latter were acidified with hydrochloric acid, precipitated by the addition of methyl alcohol, and filtered. The filtrate was treated with ferrocyanic acid or potassium ferrocyanide. The crude betaine ferrocyanide was suspended in alcohol and decomposed by means of hydrogen chloride, when betaine hydrochloride was produced in the solid form. Pyridine and trigonelline also formed yellow salts with ferro- or ferricyanic acid.—F. Shdn.

Stearic acid; Sulpho-derivatives of——. A. Eckert and O. Halla. Monatsh. Chem., 1913, **34**, 1811—1813.

Mercaptanostearic acid, $C_{16}H_3CHSH.COOH$, m. pt. 74° C., was obtained by heating α-bromostearic acid with an alcoholic solution of sodium hydrosulphide. On oxidation with alcoholic iodine solution it yielded the corresponding disulphide, $[C_{16}H_{33}CH(COOH)]_2S_2$, (m. pt. 70° to 71° C.), whilst potassium permanganate oxidised it to an impure sulphostearic acid.—C. A. M.

Per-acids from organic acids and hydrogen peroxide, Formation of——. J. D'Ans and W. Frey. Z. anorg. Chem., 1913, **84**, 145—164.

Systematic experiments on the direct production of per-acetic acid from acetic acid and hydrogen peroxide (this J., 1912, 1200), with and without catalysts, have shown that the process of per-acid formation is exothermic and that the velocity constant diminishes as reaction proceeds towards equilibrium. The formation of per-propionic and per-butyric acids is analogous to that of per-acetic acid, but in the production of per-formic acid, stable equilibrium is not reached owing to the decomposition of this acid into carbon dioxide and water. Phosphoric and hydrofluoric acids have a smaller accelerating effect than sulphuric and nitric acids.—F. Sodn.

Organosols of metals of the platinum group and of hydroxides of divalent platinum and palladium. C. Amberger. Kolloid-Zeits., 1913, **13**, 310—317.

Using wool fat in the manner described previously for the preparation of organosols of silver and gold (this J., 1912, 1006, 1007), the author has prepared organosols of palladium, platinum, palladous hydroxide, palladium oleate, and platinous hydroxide. In the preparation of the metallic organosols, hydrazine hydrate was used as reducing agent. The palladium organosols (8·9 to 16 per cent. Pd) had pronounced catalytic activity; small quantities dissolved in fatty oils were capable of transferring hydrogen to the unsaturated glycerides of the oil, with the formation of so-called hardened oils. The platinum organosols contained 8·14—18·4 per cent. Pt. The hydroxide organosols were prepared by the interaction of the corresponding chlorides and sodium carbonate and the palladium oleate organosol from the chloride and potassium oleate in presence of wool fat. A solution of the palladous hydroxide organosol in paraffin oil has been introduced as a therapeutic agent under the name of "Leptynol."—A. S.

Patents.

Hexa-amino-arsenobenzene; Manufacture of——. C. F. Boehringer und Söhne, Mannheim-Waldhof, Germany. Eng. Pat. 7488, March 29, 1913. Under Int. Conv., April 1, 1912.

4-Amino-3.5-dinitrobenzene-1-arsinic acid is reduced to 3.4.5.3′.4′.5′-hexa-amino-arsenobenzene by treatment with acid reducing agents, such as tin or stannous chloride and hydrochloric acid. The free base is very unstable, rapidly becoming dark coloured in air; it is insoluble in the usual organic solvents, but soluble in dilute acids. It is stated to possess a very powerful spirillocide effect. with comparatively small toxicity (see also Eng. Pat. 8041 of 1913; this J., 1913, 1170).—T. F. B.

Dinitro-methylnitraminophenylarsinic acids; Art of making derivatives of——. L. Ach, Mannheim, and A. Rothmann, Heidelberg, Assignors to C. F. Boehringer und Söhne, Mannheim-Waldhof, Germany. U.S. Pat. 1,081,079, Dec. 9, 1913.

A dinitro-methylnitraminophenylarsinic acid (see U.S. Pat. 1.075,279 of 1913; this J., 1913, 1128) is treated with a reducing agent, *e.g.*, tin and hydrochloric acid. In this way a di(methylamino)-tetra-amino-arsenobenzene ($CH_3NH:NH_2:NH_2:As=4:3:5:1$), melting with decomposition at about 95° C., is produced.—T. F. B.

Organic arsenic compounds; Process for preparing—— H. Bart. Ger. Pat. 267,082, March 26, 1912.

Organic arsines prepared by electrolytic reduction are treated with sulphurous acid. The products may be used for medicinal purposes or for the preparation of therapeutic compounds. The process is described as applied to 3-carboxy-ethylamino-4-hydroxyphenylarsine, obtained by electrolytic reduction of the corresponding arsinic acid.—T. F. B.

Alkali salts of aromatic stibinic acids; Process for preparing neutral, soluble ——. Chem. Fabr. von Heyden. Ger. Pat. 267,083, Aug. 6, 1912.

One mol. of an aromatic stibinic acid is neutralised by means of less than one mol. of an alkali. The neutralised solutions may be evaporated to dryness or precipitated by means of salt solution or an organic solvent miscible with water, *e.g.*, alcohol. Alkaline solutions of stibinic acids may be treated with precipitants, such as alkali hydroxide solutions or concentrated solutions of alkali salts of inorganic acids, and the precipitate washed until both the residue and the washings are neutral. The alkali salts thus obtained may be further purified by treatment with methyl alcohol.—T. F. B.

2-Phenylquinoline-4-carboxylic acid and its derivatives; Manufacture of sulphonic acids of ——. Chem. Fabr. auf Actien, vorm. E. Schering, Berlin. Eng. Pat. 16,482, July 17, 1913. Under Int. Conv., Oct. 8. 1912.

The sulphonic acids of 2-phenylquinoline-4-carboxylic acid and its nuclear substitution products are obtained by the usual methods of sulphonation. They have therapeutic properties similar to those of the 2-phenylquinoline-4-carboxylic acids from which they are derived, but they have the advantage of being soluble in warm water and having a pleasant acid taste.—T. F. B.

Tuberculosis; Substance for the treatment of —— and process of making said substance. B. S. Paschall, Seattle, Wash. U.S. Pat. 1,078,873, Nov. 18, 1913.

Tubercle bacilli are dried and powdered and the fats and waxes therein are saponified: the mixture is filtered, the filtrate evaporated, and the residue dissolved in a suitable solvent. The fatty acids are now precipitated and redissolved until they are sufficiently pure, and they are finally dissolved in a liquid which forms compounds soluble in water. When injected into animals or men, the products are said to produce a lipolytic ferment capable of dissolving a sufficient portion of the waxy protective substances elaborated by tubercle bacilli, so that the micro-organism itself is destroyed.—T. F. B.

Casein preparations; Process for producing ——. A. A. Dunham, Bainbridge, N.Y., Assignor to Casein Co. of America. U.S. Pat. 1,080.204, Dec. 2, 1913.

A slightly acid solution of about five parts of a simple glycerophosphate is mixed with powdered casein containing water, corresponding to 100 parts of dry casein, and the product is dried and powdered.—T. F. B.

Dimethylaminohydroxymethane and dimethylamine; Process for producing ——. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 460,429, July 16, 1913. Under Int. Conv., Aug. 6 and Nov. 30, 1912, and Feb. 18, 1913.

The halogen addition compounds of trimethylamine (*e.g.*, the dichloride) are treated with water and then with alkaline substances, or with alkaline solutions, or trimethylamine or one of its salts is treated with water and a halogen or a hypohalogenous acid or salt thereof; in each case dimethylaminohydroxymethane, $HO.CH_2.N(CH_3)_2$, is produced. Dimethylamine or dimethylaminohydroxymethane can also be obtained by treating a salt of trimethylamine with two mols. of hypohalogenite, and converting the halogenated dimethylamine thus produced into dimethylamine by reduction, or into dimethylaminohydroxymethane by means of an alkali.—T. F. B.

Acetaldehyde from acetylene; Process for preparing ——. Consortium f. Elektrochemische Industrie. Fr. Pat. 460,553, July 21, 1913.

The conversion of acetylene into acetaldehyde by means of solutions of mercury salts is retarded, after the reaction has been proceeding for some time, by the accumulation of aldehyde vapour in the gas mixture over the solution. The process can be carried out rapidly and continuously, without retardation, by passing acetylene in excess through mercury salt solutions, extracting the aldehyde from the gas immediately, and again passing the acetylene through the solution. The process described in Fr. Pat. 455,370 (this J., 1913, 959) is considerably accelerated by this modification; it is also possible to use stronger acids than are there indicated without risk of the formation of resinous compounds. This method is especially applicable to processes in which the acetylene is introduced into hot solutions of mercury salts, so that the aldehyde distils off as soon as it is formed.—T. F. B.

Acetic acid from acetaldehyde; Process for producing ——. Consortium f. Elektrochem. Industrie. Fr. Pat. 460,971, July 25, 1913.

The conversion of acetaldehyde into acetic acid by oxygen is accelerated by the addition of small quantities of manganese compounds; the reaction is not explosive, as is the case when compounds of chromium, vanadium, cerium, etc., are used as accelerators. *Example.* A current of dry oxygen is passed into a mixture of 300 kilos. of pure acetaldehyde and 2 kilos. of manganese acetate in a pure aluminium vessel provided with a stirrer and a cooling jacket: the manganese salt dissolves in the aldehyde, and the solution absorbs oxygen very energetically, the heat evolved being removed by external cooling. After 10 to 20 hours the absorption is complete and the acid is distilled. Air may be used in place of oxygen, and the gases may be introduced under pressure; acetic acid or other solvent may be added to the aldehyde, if desired.
—T. F. B.

Per-acids from aldehydes; Process for preparing ——. Consortium f. Elektrochem. Industrie. Fr. Pat. 460,972, July 25, 1913.

It is known that the autoxidation of aldehydes gives rise to the formation of per-acids, which, however, react with excess of aldehyde forming the lower acid. It has been found that this reduction of the per-acid can be prevented by lowering the temperature, and also that it is greatly accelerated by the presence of certain impurities in the aldehyde, especially manganese compounds and water. The per-acid may be separated from the aldehyde by converting it into a salt, *e.g.*, by adding calcium carbonate, or by freezing, or the aldehyde may be separated by means of a current of air or by distillation at as low a temperature as possible. *Example.* Dry oxygen is passed into freshly distilled acetaldehyde, cooled to a temperature of —10° to —20° C. When absorption of oxygen has ceased, the excess of aldehyde is distilled off at a temperature about 0° C. The peracetic acid remains as a crystalline mass. The absorption of oxygen can be accelerated by the influence of chemically active light rays, *e.g.*, from a mercury vapour lamp, and also by addition of small quantities of catalysts, such as compounds of chromium, cobalt, iron, uranium, and vanadium.
—T. F. B.

Scopolamine solutions; Process for preparing stable ——. W. Straub. Ger. Pat. 266,415, May 29, 1913.

Scopolamine solutions may be rendered stable by addition of a high molecular polyhydric alcohol.—T. F. B.

Ferrous compounds of monoamino acids; Process for preparing ——. F. Hoffmann-La Roche und Co. Ger. Pat. 266,522, March 16, 1913. Addition to Ger. Pat. 264,390 (see this J., 1913, 1032).

Mono-amino acids or peptones, other than glutamic acid, are converted into ferrous compounds by heating with metallic iron, air being excluded.—T. F. B.

Glycerophosphoric acid and a carbohydrate [*maltose*]; *Process for preparing a soluble, crystalline compound of* ——. E. Jacoby. Ger. Pat. 266,576, Aug. 4, 1912.

Condensation of glycerophosphoric acid and maltose may be effected by heating the substances to about 110° C.; the product is obtained in solid, crystalline, soluble form by cooling.—T. F. B.

Mercury compound of the pyrazolone series; Process for preparing a ——. L. Givaudan and E. Scheitlin. Ger. Pat. 266,578, May 12, 1912. Addition to Ger. Pat. 261,081.

Compounds containing more mercury than those prepared according to the principal patent (see this J., 1913, 768) are obtained by the action of mercuric oxide on 1-phenyl-2.3-dimethyl-4-sulphamino-5-pyrazolone in presence of an alkali bisulphite. The products are said to contain from 65 to 68 per cent. of mercury.—T. F. B.

Silver-albumin compounds soluble in water; Process for preparing ——. A. Dering. Ger. Pat. 266,655, Oct. 22, 1911.

The silver salts of lysalbinic or protalbinic acids are treated with aqueous solutions of hexamethylenetetramine, and the double compounds are separated from the resulting solutions either by evaporation, preferably in a vacuum, or by precipitation with alcohol or other organic solvent. The products are stated to possess powerful bactericidal properties.—T. F. B.

Hexamethylenetetramine-methyl thiocyanate; Process for preparing ——. K. H. Schmitz. Ger. Pat. 266,788, Feb. 4, 1913.

A double compound of methyl thiocyanate with hexamethylenetetramine may be obtained either by the interaction of the components, with or without addition of a solvent, or by treating hexamethylenetetramine with the methyl ester of an inorganic or organic acid and decomposing the intermediate compound by means of an easily soluble thiocyanate. The new compound may be used for medicinal purposes.—T. F. B.

Aseptically-sterile thread and bandages; Process for preparing ——. R. Graf. Ger. Pat. 266,953, Dec. 1, 1912.

The material is treated with Peru balsam, to render it free from bacteria and to give it bactericidal properties, at the same time making it permanently flexible.—T. F. B.

Alkaloids of ipecacuanha; Process for obtaining the ——. Chem. Werke vorm. Dr. H. Byk. Ger. Pat. 267,219, July 5, 1912.

The alkaloids are extracted from the crude material in the form of their salts, by means of an organic solvent, such as chloroform, carbon tetrachloride, or benzene, preferably with the addition of a small quantity of alcohol; the salts are precipitated from the solution by means of ether or other suitable substance. In this process the decomposition of some of the alkaloids, which occurs when alkali is used for the extraction, is avoided.—T. F. B.

Alkaloids and alkaloidal salts; Processes of extracting, purifying or preventing the solution of ——. J. U. Lloyd, Cincinnati, U.S.A. Eng. Pat. 27,378, Nov. 28, 1912. Under Int. Conv., Feb. 23, 1912.

See U.S. Pat. 1,048,712 of 1912; this J., 1913, 161.—T.F.B.

Terpene hydrocarbons from terpene hydrohalogenides; Process for the manufacture of ——. A. Meyer, Mulhausen, Alsace. Eng. Pat. 28,497, Dec. 10, 1912. Under Int. Conv., Feb. 22, 1912.

See Fr. Pat. 451,645 of 1912; this J., 1913, 625. Reference is directed in pursuance of Sect. 7, Sub-sect. 4, of the Patents and Designs Act, 1907, to Eng. Pats. 10,783 and 25,453 of 1907.—T. F. B.

Preparation of mercury; Process for producing an effective ——. L. Givaudan, Vernier, and E. Scheitlin, Basle, Switzerland. Eng. Pat. 29,066, Dec. 17, 1912. Under Int. Conv., Dec. 20, 1911.

See Ger. Pat. 261,081 of 1911; this J., 1913, 768.—T. F. B.

Tobacco; Process of treating ——. D. A. Gallagher and W. A. Miller, York, Pa., U.S.A. Eng. Pat. 10,557, May 5, 1913.

See U.S. Pat. 1,062,093 of 1913; this J., 1913, 672.—T. F. B.

Isoprene; Process for manufacturing ——. C. K. F. L. Gross, Bevön, Norway. Eng. Pat. 13,825, June 14, 1913. Under Int. Conv., June 15, 1912.

See Fr. Pat. 459,988 of 1913; this J., 1913, 1129.—T. F. B.

Erythrene, its homologues and derivatives; Process for producing ——. Farbenfabr. vorm. F. Bayer und Co. First Addition, dated June 17, 1913, to Fr. Pat. 425,967, Feb. 11, 1911. Under Int. Conv., July 25, 1912.

See Ger. Pat. 262,884 of 1912; this J., 1913, 924.—T. F. B.

Unsaturated hydrocarbons; Process for making ——. F. E. Matthews, H. J. W. Bliss, and H. M. Elder. Fr. Pat. 460,573, July 21, 1913. Under Int. Conv., July 24, 1912.

See Eng. Pat. 17,234 of 1912; this J., 1913, 884.—T. F. B.

Strontium salt of cholic acid. R. Werner, Ludwigshafen on Rhine, Germany. U.S. Pat. 1,081,178, Dec. 9, 1913.

See Ger. Pat. 254,530 of 1911; this J., 1913, 110.—T. F. B.

Amino- and diamino-ketones; Process for preparing aliphatic ——. Farbenfabr. vorm. F. Bayer und Co. First Addition, dated June 13, 1913, to Fr. Pat. 450,543, Oct. 28, 1912. Under Int. Conv., June 20, 1912.

See Eng. Pat. 14,231 of 1913; this J., 1913, 1128.—T.F.B.

Betaine salts; Process for making ——. Act.-Ges. f. Anilinfabr. Fr. Pat. 460,478, July 17, 1913. Under Int. Conv., Jan. 30, 1913.

See Eng. Pat. 16,710 of 1913; this J., 1913, 990.—T. F. B.

Hydrogenating unsaturated substances; Process for ——. R. Lessing. Fr. Pat. 460,771, July 26, 1913. Under Int. Conv., Aug. 19, 1912.

See Eng. Pat. 18,998 of 1912; this J., 1913, 917.—T.F.B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Absorption spectra of sulphurous acid and sulphites. (*Prelim. Note.*) R. Wright. Chem. Soc. Proc., 1913, **29**, 339.

While comparing the absorption spectra of various acids and of their salts, it was found that the absorption of sulphurous acid is characterised by a band in the ultraviolet, the sodium salt exhibiting only general absorption. It is thought that this is most probably due to a difference in structure between the acid and its salt. A parallel case is to be found in the behaviour of chromic acid, where a strong acid differs in visible colour from its salts.

Patents.

Photographic printing paper. J. J. C. M. Sury. Fr. Pat. 460,426, July 16, 1913.

A non-porous, sized or varnished paper support is supplied with a coating of a colloid in which is suspended a colourless, inert powder, such as powdered glass, very fine sand, etc. The paper is sensitised by means of an alkali bichromate, exposed and developed in water as usual, and dusted with a black or coloured powder mixed with fine sand, etc. The colour is said to adhere only to the parts from which the colloid has not been removed.—T. F. B.

Photographs in colours; Process for producing ——, and products resulting therefrom. The Hess-Ives Co. Fr. Pat. 461,078, Aug. 4, 1913. Under Int. Conv., Aug. 5, 1912.

In the preparation of photographs in colours by superposition of stained transparent relief positives, it is proposed to incorporate in the sensitive colloid for the positive, before exposure, a soluble, non-actinic colouring matter which will retard the penetration of the light and render the relief extremely delicate; by this means, a sufficiently slight and uniform penetration of the colouring matter is assured during the subsequent staining. A collodion containing camphor, and prepared by means of amyl acetate, may be used as the adhesive for joining together the coloured positives.—T. F. B.

XXII.—EXPLOSIVES; MATCHES.

Use of explosives for removing obstructions in the blast-furnace. Schöneweg. *See* X.

Patents.

Explosives; Safety ——. E. Herz, Vienna. Eng. Pat. 11,809, May 21, 1913.

Pentaerythrite-tetranitrate (preferably about 15 per cent.) is added to ammonium nitrate explosives, in order to produce easily detonating safety explosives of great density.—T. St.

Detonators; Manufacture of ——. C. Claessen. First Addition, dated July 7, 1913, to Fr. Pat. 459,979, May 29, 1913 (this J., 1913, 1171).

Instead of the mercury fulminate or mixture of mercury fulminate and potassium chlorate used as described in the chief patent, black powder, guncotton, smokeless powder, picrates, perchlorate explosives, etc., may be employed. —A. S.

2.4.6.2′.4′.6′-Hexanitrodiphenyl sulphide: Process for preparing —— and its use in making explosives. Sprengstoff A.-G. Carbonit. Fr. Pat. 460,571, July 21, 1913.

Two mols. of 1-chloro-2.4.6-trinitrobenzene react with one mol. of sodium thiosulphate in presence of water, 2.4.6.2.′4.′6′-hexanitrodiphenyl sulphide being formed according to the equation, $2.C_6H_2(NO_2)_3Cl+Na_2S_2O_3+H_2O=2NaCl+H_2SO_4+[C_6H_2(NO_2)_3]_2S$. The sulphuric acid formed must be neutralised, *e.g.* by addition of an alkali or alkaline-earth carbonate to the reaction mixture. Yields of 90 per cent. of the theoretical quantity are said to be obtained by boiling the components in presence of alcohol. The use of more than one mol. of thiosulphate to two mols. of chlorotrinitrobenzene gives rise to a dark coloured product. The crystallised or compressed product may be used in the preparation of explosives, either alone or mixed with other nitro-hydrocarbons, oxygen-carriers, etc.—T. F. B.

Match-splint material; Process of treating ——. W. A. Fairburn, Short Hills, N.J., Assignor to The Diamond Match Co., Chicago, Ill. U.S. Pat. 1,079,119, Nov. 18, 1913.

To prevent glowing after the matches are extinguished, the match splint material is impregnated with an oxide of phosphorus by exposing it to the fumes generated by gently heating phosphorus in a limited supply of air, and is then exposed to the air.—A. T. L.

Explosives. R. Kolowratnik, Peggau, Austria. Eng. Pat. 26,884, Nov. 22, 1912.

See Fr. Pat. 452,554 of 1912; this J., 1913, 674.—T. F. B.

XXIII.—ANALYTICAL PROCESSES.

Iron; Diphenylcarbohydrazide as an indicator in the bichromate titration of ——. L. Brandt. Z. anal. Chem., 1913, **53**, 1—20.

One grm. of ore is dissolved in 50 c.c. of strong hydrochloric acid, reduced with stannous chloride solution, and the excess of the latter destroyed by mercuric chloride as usual. The solution is poured into 1·5 litre of water and 75 c.c. of manganese sulphate mixture, and after addition of 5 c.c. of indicator, titrated with bichromate until the purple colour changes into a pure green due to chromic chloride. The amount of hydrochloric acid present should be equivalent to 20—25 c.c. of acid of 1·19 sp. gr. The indicator is prepared by dissolving 0·1 grm. of symmetrical diphenylcarbohydrazide, $CO(NH.NH.C_6H_5)_2$, in 35 c.c. of strong acetic acid and breaking up the lumps by means of a glass rod; the volume is then made up to 100 c.c. with distilled water. It can be kept for several days; the solid reagent deteriorates after 1—1½ years. The method has been tested with satisfactory results for quantities of 0·05—0·74 grm. of iron. Platinum (from the crucible, if a bisulphate fusion is made) causes high results and a bad end-point. Arsenic does not interfere if below 0·75 per cent., while copper lowers the result as in the case of the Zimmermann-Reinhardt method.—W. R. S.

Chromium: Determination of —— as chromic oxide. G. Rothaug. Z. anorg. Chem., 1913, **84**, 165—189.

The gravimetric determination of chromium as oxide is found invariably to give somewhat high results owing to the absorption by the precipitate, during ignition, of a small proportion of atmospheric oxygen, with the formation of chromic chromate ($Cr_2O_3,3CrO_3$). Accuracy is secured, however, by igniting in a current of hydrogen. —F. Sodn.

Silica; Dehydration and recovery of ——, in analysis. F. A. Gooch, F. C. Reckert, and S. B. Kuzirian. Amer. J. Sci., 1913, 36, 598—604.

The difficulty of bringing to constant weight by ignition the silica separated in the ordinary way from fusions by acidifying and evaporating to dryness, arises not from the retention of water by the silica, but from its containing some substance slowly volatilised or decomposed by heat. This substance is usually sodium chloride, and it is converted into sodium silicate by ignition. After treatment of the silica by hydrofluoric and sulphuric acids, this remains as sodium sulphate; and from the weight of this residue the equivalent weight of sodium oxide must be calculated to correct the actual weighings. The authors confirm the generally accepted fact that after a fusion the silica cannot be completely recovered except by two successive evaporations and filtrations.—J. T. D.

Phosphoric acid; Study of the Pemberton-Kilgore method for determination of ——. P. L. Hibbard. J. Ind. Eng. Chem., 1913, **5**, 998—1009.

The effect of varied experimental conditions on the volumetric determination of phosphoric acid by titration of the yellow molybdate precipitate with alkali (this J., 1894, 176, 667; 1895, 303, 511), was studied. Minute details of the conditions found necessary for obtaining the best results are given, together with a bibliography of previous work on the subject. (See also this J., 1913, 738, 898.)—A. S.

Potassium xanthate [*and mercury*]; *Volumetric determination of* ——. B. Holmberg. Ber., 1913, **46**, 3853—3859.

If a solution of potassium xanthate be treated with a known excess of $N/10$ hydrochloric acid and left for 10 mins. to ensure the complete decomposition (into alcohol and carbon bisulphide) of the liberated xanthic acid, the excess of hydrochloric acid may be titrated with baryta in presence of phenolphthalein or methyl red, and the quantity of xanthate calculated. The method may be utilised for the determination of metals, especially mercury, which form insoluble xanthates, an excess of a standardised solution of potassium xanthate being added and then the excess determined as described above. In the case of mercuric bromide, chloride or sulphate, it is not necessary to filter off the mercuric xanthate, but this must be done in the case of mercuric iodide, as mercuric xanthate is decomposed slowly by acids in presence of iodides Provided no other metal which forms an insoluble xanthate and no oxidising agents (*e.g.* nitric acid) are present, mercury can be determined in this way more rapidly and simply than by any other method. Potassium xanthate keeps well in dry air and can be readily purified by recrystallisation from absolute alcohol.—A. S.

Nitrogen in nitro-bodies by Kjeldahl's method; Bohn-Schmidt reaction in the benzene series, and the determination of ——. A. Eckert. Monats. Chem., 1913, 34, 1957—1964.

By the action of sulphur sesquioxide (*i.e.* of a solution of sulphur in fuming sulphuric acid) on 20 grms. of nitrobenzene in the cold, a mixture of amino- and imino-compounds was produced, and the ease with which the nitro-group is reduced led the author to apply the method in the Kjeldahl analysis of nitro-compounds. A large number of aromatic nitro-compounds gave excellent results after warming for one hour on the water-bath with 0·4 grm. of sulphur and 15 to 20 c.c. of 30 to 40 per cent. fuming sulphuric acid. The aliphatic nitro-compounds and inorganic nitrates, however, yielded low results by this method.—W. H. P.

XXIV.—MISCELLANEOUS ABSTRACTS.

Autoxidations. VI. Chemical action of light. XXVIII. G. Ciamician and P. Silber Ber., 1913, **46**, 3894—3899.

It has been shown previously by several investigators that substances which alone are not autoxidisable may become oxidised in presence of substances which readily undergo autoxidation. Further examples of this phenomenon are given. Ethyl and amyl alcohols, glycerol, mannitol, dextrose, and naphthalene are not oxidised when exposed to light in the presence of oxygen; but if an easily autoxidisable substance such as toluene or *m*- or *p*-xylene be added, then both substances are oxidised when exposed under similar conditions.—A. S.

Studio Microscopico e Chimico pel Riconoscimento delle Fibre Vegetali, Lane, Peli, Pelliccie, Sete Naturali, Sete Artificiali. Analisi Quantitativa dei Tessuti ed altri Manufatti Tessili. Di A. Solaro. U. Hoepli, Milan. 1914. Price L. 25.

This work (13¾ by 8⅞ ins.) on the microscopical and chemical examination of animal and vegetable fibres and the analysis of textiles contains 417 pages of subject matter, including 400 photomicrographs and 30 tables, and also an alphabetical index and a bibliography. The arrangement of the text is as follows: General part, dealing with the use of the microscope, the preparation of microchemical and chemical reagents, and the general distinctive characters of animal and vegetable fibres and artificial silks. Part I. Vegetable fibres, comprising descriptions of the specific characters and properties of the different vegetable fibres. Part II. Animal fibres: wools, hairs or furs. Part III. Animal fibres: natural silks. Part IV. Artificial silks. Appendix. Quantitative analysis of textiles, including methods for dyed mixed fabrics of cotton and wool; cotton and natural and artificial silks; wool and natural and artificial silks; cotton, wool and silk, etc.

Studien ueber Schutzkolloide. Erste Reihe: Stärke als Schutzkolloid. I: Ueber kolloides Silber. II: Ueber kollodes Gold. A. Gutbier and E. Weingärtner. Kolloidchemische Beihefte. Band V. Heft 6. Verlag von T. Steinkopff. Dresden and Leipzig. 1913. Price M. 1.20.

This work contains 58 pages, 9$\frac{3}{16}$ by 6$\frac{3}{16}$ ins., and relates to the behaviour and action of starch as a protective colloid in the case of silver and gold sols.

Les Classiques de la Science. Publiés sous la direction de MM. H. Abraham, H. Gautier, H. Le Chatelier, J. Lemoine. Libraire Armand Colin, 103, Boulevard Saint-Michel, Paris. 1913.

I. L'Air, L'Acide Carbonique et L'Eau. Mémoires de Dumas—Stas—Boussingault. Price 1 fr. 30.

Volume (7¾ by 5 ins.) containing 104 pages of subject matter with 4 plate illustrations outside the text. The text is classified as follows:—I. Biographical sketches of Dumas, Stas, and Boussingault. II. Dumas and Boussingault's researches on the exact composition of atmospheric air. III. Dumas and Stas's researches on the atomic weight of carbon. IV. Stas's new researches on the atomic weight of carbon. V. Dumas' researches on the composition of water.

II. Mesure de la Vitesse de la Lumière. Etude optique des Surfaces. Mémoires de Léon Foucault. Price 1 fr. 30.

Volume (7¾ by 5 ins.) containing 123 pages of subject matter with 3 sheets of illustrations, besides 30 figures in the text. The subject matter is classified under two heads:—I. Measurement of the velocity of light. II. Optical study of surfaces.

III. Eau Oxygénée et Ozone. Mémoires de Thénard, Schoenbein, De Marignac, Soret, Troost, Hautefeuille, Chappuis. Price 1 fr. 20.

Volume (7¾ by 5 ins.) containing 111 pages of subject matter with one sheet of engravings. The subject matter is classified under two heads:—I. Hydrogen peroxide. II. Ozone.

IV. Molécules, Atomes, et Notations Chimiques. Mémoires de Gay-Lussac—Avogadre—Ampère—Dumas—Gaudin—Gerhardt. Price 1 fr. 20.

Volume (7¾ by 5 ins.) containing 116 pages of subject matter, with 1 plate of illustrations outside the text. The text is classified as follows:—I. Gay-Lussac. Combination between gases. II. Avogadro. Determination of the relative masses of the elementary molecules of substances and the proportions in which they enter into combination. III. Ampère. Determination of the proportions in which bodies combine according to the number and the respective disposition of the molecules. IV. Dumas. On some points regarding the atomic theory. V. Gaudin. Structure of definite inorganic bodies. VI. Dumas. Chemical notation. VII. Gerhardt. General review of the notation and arrangement of formulæ.

Year Book of Pharmacy, comprising Abstracts of papers relating to Pharmacy, Materia medica, and Chemistry contributed to British and Foreign Journals from July, 1912, to June 30, 1913, with the Transactions of the British Pharmaceutical Conference at the fiftieth Annual Meeting held in London, July 21—24, 1913. Editors, J. O. Braithwaite and R. R. Bennett. Compiler of New Remedies Section, F. W. Gamble. J. and A. Churchill, 7, Great Marlborough Street. 1913. Price 10s. 6d.

Volume (8¾ by 5¾ ins.) containing 624 pages of subject matter, list of members since June, 1912, and list of home members, followed by Indexes (alphabetical) of subjects and authors. As a frontispiece a portrait is given of Mr. J. C. Umney, the President, 1912-1913. The work is divided into two parts, the first being devoted to abstracts of articles in home and foreign journals, the second, to the transactions of the Pharmaceutical Society and of the British Pharmaceutical Conference (1912—1913).

Die Gerbstoffe. Botanisch-Chemische Monographie der Tannide. Von Dr. J. Dekker, Direktor der Abteilung "Handelsmuseum" des Niederländischen Kolonial-Instituts. Gebrüder Borntraeger's Verlag. Berlin. W. 35. Schönberger Ufer 12a. 1913. Price M. 20.

Volume (10⅜ by 7¼ ins.), containing 586 pages of subject matter, with 3 illustrations, and alphabetical indexes of authors and subjects. The work is dedicated by the author to Emil Fischer, and it is a compendium of the researches that have been made in connection with the subject of tanning agents and tanning, in the years commencing with 1754, and ending with present date. These investigations are arranged under the annual dates progressively, the names of the investigators and authors coming first, and following in alphabetical sequence, under the several years. Thus, for each year there is a separate alphabetically arranged list of tannin researches, etc. This occupies Chapter I. of the work. Chapter II. is devoted to the distribution of the tannins in the vegetable kingdom. III. Physiology and methods of investigation. IV. The chemistry of the tannins. V. Quantitative analysis. VI. Tanning and dyeing.

Who's Who in Science (International), 1914. Edited by H. H. Stephenson. J. and A. Churchill, 7, Great Marlborough Street, London. 1913. Price 10s. net.

A biographical dictionary and directory combined, forming a volume 9½ by 6 ins. The volume contains 662 pages of subject matter, commencing with a list of abbreviations used, an Obituary (1913), and condensed tabulated lists of the world's universities. The biographies, alphabetically arranged, now follow, and continue from page 119 to 621. These are followed and the work concluded, by a classified index of names of scientists arranged under the different branches of pure and applied science represented, and in the different countries to which they belong.

Mines and Quarries. General Report, with Statistics for 1912, by the Chief Inspector of Mines. Part II.—Labour. [Cd. 7166.] Wyman & Sons, Fetter Lane, E.C. Price 2s.

This publication contains a general report and statistics relating to persons employed and accidents at mines and quarries in the United Kingdom, and to the enforcement of the Mines and Quarries Acts.

Mineral Products of the United States: Review of Conditions and Output. By E. W. Parker. With a Summary of Mineral Production in 1912 by W. T. Thom. U.S. Geological Survey, Washington.

The Production of Copper, Gold, Lead, Nickel, Silver, Zinc, and other Metals in Canada during 1912. By C. T. Cartwright. Canada Dept. of Mines. Mines Branch. Bulletin No. 256.

PROF. E. C. C. BALY IN THE CHAIR.

THE HURTER MEMORIAL LECTURE, "MODERN CHEMICAL INDUSTRY."

BY PROF. FRITZ HABER.

It is a special honour to me to speak here in appreciation of a man who recognised and represented the importance of physical thinking in applied chemistry at a time when almost without exception technical chemists declined to take this view.

Thirty years ago, when Hurter's activity was at its height, the centre point of chemical industry was the Leblanc soda process. Here in England a number of technical methods for the manufacture of sulphuric acid and Glauber's salt, bleaching powder, soda, potash and the alkalis had been developed up to a remarkable standard. It is impossible to admire too much the richness of inventive genius and the clearness of judgment which the technical chemists of this period developed in your country. The world has learned of them how to convert chemical laboratory reactions into industrial technical processes and how to build up a system of analytical controls which enables the manager to follow the chemical change in a complicated system of reactions on a large scale.

The picture that technical chemistry exhibits to-day is quite different from that of thirty years ago. There is more brilliancy around the accomplishment of the organic than of the inorganic industries. The replacement of natural dyes by the products of coal tar, the extension of our medical resources by the manufacture of synthetic medicines, has gone far to extend the appreciation of chemical work and to produce the general conviction that chemistry is an inexhaustible field of economic possibilities. Indeed, one natural product after another falls into the domain of chemical synthesis, and chemistry is becoming the important factor in the economy of the tropical products which are used for industrial purposes. As soon as the price of such a product exceeds a certain limit organic chemistry enters the field and synthesises it in Western Europe. Thus indigo has succumbed to the onslaught of organic chemistry. Tanning materials at present are in a struggle with the condensation products of formaldehyde and phenolsulphonic acids. Camphor could only maintain its position by large price reduction, and the prospect of synthetic rubber holds down the would-be inflated prices of the natural product. The basis of this marked development in organic chemical industries is the combined working of science and technology. The fact and the success of this intermingling is so obvious that we need not dwell on the point.

In the territory of inorganic technical chemistry things are somewhat different. Here also a great change has taken place. The historical sulphuric acid and soda processes have lost much ground to the ammonia-soda and electrolytic processes, and to the contact process. New branches of industries have taken root and grown up. In this field, however, the connection between scientific and technical progress is neither so obvious nor so well recognised as in the realm of industrial organic chemistry. The reason lies in this, that the advance in inorganic science, during the last decade or two, has resulted less in the discovery of new facts which had direct technical applications, than in the unravelling and working out of new theoretical views. In fact, the introduction of physical laws and physical methods into the working sphere of inorganic chemistry has led to the greatest scientific progress. The invasion of physics into chemistry has produced the splendid development of physical chemistry, the basis of which is the second law of thermodynamics, the phase rule, and the theory of electrolytic dissociation. The introduction of the electroscope into chemical analysis has opened up the new chemical world of radioactivity. Now, in my opinion, inorganic chemical industries can gain almost as much by regarding their problems from a physical point of view as organic industries do by the application of structural considerations.

I do not think it will be out of place in this lecture if I speak of one or two inorganic technical questions and lay stress on the physical considerations which bear on them. I may be permitted to pass by many of the current examples of the part played by physical chemistry in technical chemistry owing to their general recognition and go on to speak of a few industrial cases with which I have come in contact during the last year or two.

During the last few years a not very obvious property of stannic acid has become the source of a new inorganic industry. Iron cooking utensils are coated on the inner side with a white enamel* which must contain no poisonous material; owing to its relatively low coefficient of expansion it must be very thin so as not to crack and chip away when the iron expands through rise of temperature. It must have a low melting point so that the iron does not lose its shape when it is coated with the melted enamel. A glass is therefore used which has nearly the following constitution: Borax 26 per cent.; quartz, 17 per cent.; felspar, 34 per cent.; sodium silico-fluoride, 13 per cent.; soda, 4 per cent.; saltpetre, 3 per cent.; kaolin, 3 per cent. The constituent parts are melted together; the fused mass is ground with water and some plastic clay to a thin paste of suitable thickness for even coating, then dried on the iron and heated to a temperature of 800° C. for about a minute, whereby fluxing of the enamel is attained. That is roughly the technology of enamelled iron. But such an enamel is too transparent. For the thin coating, which it is necessary to use on the iron, permits the dark colour of the background to be seen. It is desirable to add something which, in small quantities, will render the enamel quite opaque, and which will at the same time give it a clear white colour. The only satisfactory substance up to the present has been stannic acid. The requisite amount for a given surface is small, about one-half gram being required per square decimeter, but the employment of enamelled iron utensils is so great that 3 million kilos. of stannic acid are used yearly for this purpose. In earlier times about double the amount of stannic acid was used per unit area, as it was mixed and melted with the other constituents of the glass, and not, as at present, added to the enamel paste before the baking process.

The substitution of stannic acid by an equally efficient and non-poisonous but cheaper clouding medium has long been sought for by the enamel industry. Many and various substances have been tried and now it seems as if the problem has been solved.

The naturally occurring zirconium silicate is treated by alkali and a product of roughly the following composition is obtained: ZrO_2, 83 per cent.; TiO_2, 4 per cent.; SiO_2, 9 per cent.; Na_2O 2 per cent., the remainder being water. This impure zirconium oxide is replacing stannic acid. It is used in the same quantities and in the same way.

The development of this new industrial process has brought forward the question as to whether the specific property of the product is due to the oxide of zirconium or to some peculiar physical state that it possesses which could be imparted to other substances or perhaps to the impurities contained besides the oxide of zirconium. These questions are solved by some simple considerations.

---

* See Paut Raudau, "Die Fabrikation des Emails und das Emaillieren," Wien und Leipzig, 1909; Julius Grünwald, "Theorie und Praxis der Blech- und Gassemailindustrie," Leipzig, 1908, and "Chemische Technologie der Email-Rohmaterialien," Dresden, 1911; further "Ausgewählte Kapitel aus der Emailliertechnik," herausgegeben von der Redaction des Sprechsaals. Coburg, 1912.

Zirconium oxide is like tin oxide, namely, when in large crystals, a transparent colourless body. Now to render a glass opaque by the intermixture of particles of such a body the two substances must have different indices of refraction. The greater the difference, the greater will be the specific power of the particles to render the glass opaque. Now, the easily melting glasses which are used for enamels have a coefficient of refraction in the neighbourhood of 1·5. Natural tin oxide has the refractive index—for yellow light—of 1·9966 or 2·0799, according to the axis chosen. Its refractive power is therefore far greater than that of the glass. This property accounts for its utility in making enamels opaque.* Natural zirconium silicate has very similar refractive indices, being only about one unit smaller in the first place of decimals. Calculating from the well known additive properties of molecular refraction we find that the removal of the relatively feebly refracting silica from the zirconium silicate will increase its coefficient so that pure zirconium oxide will have a refractivity about 10 per cent. greater than pure tin oxide. Thus we may expect that zirconium oxide with or without the above-mentioned impurities of the technical product acts like tin oxide if it is equally finely divided in the glass. Differences will, however, appear if one of the oxides dissolves in the enamel to a much greater extent than the other. The fact that only half the tin oxide is required when it is not melted with the enamel, but only mixed with it before roasting, shows that it is not so much a question of solubility, but of the rate at which it dissolves. Now the oxide dissolves only after the melting of the glass and the melting is stopped the moment the heat coming from above renders the surface mirror-smooth. Thus there is only time for a limited solvent action of the glass to take place. From this we gather that an equally small quantity of suitably calcined zirconium oxide or of tin oxide will probably render the enamel equally opaque. With voluminous zirconium oxide prepared by heating pure commercial zirconium nitrate to 800° this conclusion was easily proved by a few experiments. Some minor points about the composition of the enamel would have to be considered if we would go into the subject more fully.† The former difficulty of finding empirically a substitute for tin oxide is now made plain by inspection of a table of refractive indices, because we find that the oxides of tin and zirconium have peculiarly large indices among the substances which are colourless, stable at high temperature and non-poisonous. The oxide of titanium which forms a small part of the technical product would be even better alone, because of its still larger refractive index, but the enamels made opaque by it show a yellowish colour.

I will now pass from the zirconium oxide to its accompanying mineral monazite sand and speak for a moment of a new factor in its industrial treatment. Since the introduction of the Welsbach mantle for lighting purposes, monazite sand has been worked up in large quantities for the production of thorium nitrate. In the last two years a new and very peculiar question has arisen for this industry by the demand of the medical profession for radioactive substances which give penetrating γ-rays. There are in a thousand metric tons of the usual monazite sand containing 5 per cent. of thorium oxide, according to the current radioactive figures, 18 milligrammes of such a radioactive substance. The value of these few milligrammes in a sufficiently concentrated form exceeds the value of any other substance known and covers the original cost of the 1000 tons of monazite sand. Now, the problem was to get these few milligrammes out of the thousand tons in the normal thorium extraction process. This extremely valuable substance is the mesothorium I. of Dr. Hahn, which by changing into mesothorium II. becomes a much more powerful source of γ-rays than radium itself in equilibrium with its products.

The problem is solved by the addition of 0·1 per cent. of barium to the sand before treating it with sulphuric acid in the usual way. In due course we get a radioactive deposit of barium sulphate rendered impure with SiO_2, TiO_2, lead, and rare earths. These impurities must be separated by four distinct chemical processes, resulting finally in the regaining of barium sulphate with radioactive impurities only. This product is then concentrated by the ordinary methods using the chloride, carbonate, and bromide of barium, up to the γ-ray activity of pure radium bromide, or in excess thereof. One might certainly expect from such a complicated process that the largest part of the 18 mgr. would be lost. The real result however is found by comparing, using the α-ray method, the amount of mesothorium in the final concentrate and in thorium in equilibrium with its transformation products. Dr. Keetman and Dr. Mayer have done so* and obtained the astounding result, that the figures are nearly the same. How is that to be explained? The sand always contains a small amount of uranium (say 0·1 per cent.) and in consequence its equivalent of radium, which is saved together with the mesothorium. The amount of radium in the sand and in the final concentrate is determined by using the emanation method of estimation. Keetman and Mayer have also made this comparison and found an equally quantitative agreement. This yield also is almost theoretical. The quantity by weight of the radium is much greater than that of the mesothorium in the sand as well as in the final product. The final radioactive product of the 1000 tons shows a γ-radiation equivalent to 2200 mgrms. of $RaBr_2$, three-tenths of which come from the bulk of real $RaBr_2$, while seven-tenths are due to the small admixture of the much more powerful mesothorium bromide. We have learnt from Soddy and Fajans that radioactive elements occurring on the same place of the periodic system are inseparable by any chemical means. Therefore, according to this rule the quantitative extraction of mesothorium follows from the quantitative extraction of the larger mass of radium. That the latter accompanies the barium fully is usually explained by the greater insolubility of the radium sulphate and their isomorphism.

I wonder whether this explanation will be final. Perhaps adsorption plays an important part, even in case the sulphates should be able to dissolve into each other in the solid state like alcohol and water in the liquid state. Diffusion is so extremely slow with solids, that the surface phenomena become more prominent in all rapid changes. The work done by Ritzel† here at Liverpool in this laboratory on the suggestion of Donnan induces us to regard adsorption as the primary step even in the case that a solid solution can be formed. Now there are certain facts stated quite recently by Fajans and Beer,‡ which suggest a near connection between adsorption and chemical affinity. On the other hand we have learnt from Braggs' new brilliant investigations, that the ordinary solid crystalline salts are not systems in which one anion and one cation form a molecule which is separated from the next, but that one cation is probably bound to all the surrounding anions and one anion to all the surrounding cations. In consequence of that, we may feel inclined to consider the possibility of chemical forces acting between the atoms or ions in the surface of the solid precipitates and the molecules or ions in the final layer of the surrounding liquid, *i.e.* in the adsorption layer. We may remember that there are good reasons for the belief that chemical forces are of electrical character and we know from electro-osmosis and similar phenomena that electrical forces are always acting between the surface of the solids and the adjacent layer of fluid. Adsorption phenomena, which are especially instructive with radioactive substances owing to our being able to detect the presence of minute quantities, may thus perhaps be brought in close connection with chemical affinities.

---

* So far as I am informed, this view is not mentioned in the literature of enamel. But I have recently found that Wilhelm Ostwald, in his "Malerbriefe," Leipzig, 1904, explains the property of white lead of giving the greatest opacity for painting by help of the analogous consideration for oil and carbonate of lead.

The working up of the rare earths presents many physical-chemical points of interest. It is tempting to speak of the electrolytic preparation of the so-called "Mischmetall" containing 80–90 per cent. cerium (the rest consisting of didymium and lanthanum) and its use for patent lighters, or about the manufacture of pure fluorides of the rare earths used for the salted arc to make the light white, or of the special properties which a thorium nitrate must show in order to give good Welsbach mantles. I will just consider one point more in detail because it is a good example how the same simple consideration elucidates problems in very different branches of chemical working. The splendid reasoning of Le Chatelier explained the property of the Welsbach mantle in producing more light when heated by a Bunsen flame than any other radiator, as being due to the fact of the transparency of its substance in the infra-red region. In virtue of this transparency the mantle is unable to give off the heat imparted to it by the burning gas by the emission of heat wave energy. At the same temperature the Welsbach mantle radiates no more light than other substances, but in a given flame it gets hotter and more nearly approaches the temperature of the flame than does any other substance owing to this lack of heat radiation. From this state of things high light economy results, as we get with gas of a heating power of 5000 grm. cal., one Hefner candle-power for an hour with the consumption of 0·8—0·9 l. of coal gas using the inverted type of burner which, as it is known, affords a certain amount of previous heating. Now, by using a compressed air burner we can increase the economy to 0·6 l. of gas per Hefner candle-power with the same gas without more previous heating than in the former case. At first sight we may be led to think that the compressed air flame is hotter, but on closer consideration it will be evident that this is wrong. A Bunsen flame consists of two extremely thin reaction zones, the internal cone and the external one, the latter being used for heating the Welsbach mantle. In the internal cone the admixed air burns in an excess of gas, whilst in the outer cone the burning components undergo complete combustion with the air, forming CO_2 and water. The position of the outer cone is fixed by the fact that in this zone the quantity of oxygen present must be exactly the theoretical amount required for complete combustion. Here, as there is no excess of air, the temperature only depends on the calorific value of the gas and the specific heat of the products of combustion, and is therefore at the maximum attainable with this gas and air. Thus the temperature of a blow pipe, using air, and gas of the same composition cannot exceed this maximum. Nevertheless the mantle does get hotter in the blow pipe as is proved by the fact of increased economy. We do not even need this special observation of the mantle, as everyone knows from elementary experience that things can be heated to a much higher temperature in a blow pipe than they can in a Bunsen flame. Now, why is this the case? An explanation has been suggested in the fact that as the blow pipe has a smaller flame, the production of heat takes place in a more confined region. But this fact is really no explanation as we do not heat a geometrical space, but a quantity of gas, and we have just proved that it is impossible to get it hotter than it becomes in the outer cone of a Bunsen flame. To find the proper explanation we must consider a phenomenon that has no very obvious connection with this subject, namely the dissolving of crystals in water. On this subject we have the theory inaugurated by Noyes and Whitney, and developed by Nernst, which states that the layer of liquid in contact with the crystal always consists of saturated solution. This saturated layer is continually losing its dissolved substance to the unsaturated further removed layers and at the same time being resaturated from the surface of the crystal. If the liquid is stirred this surface layer remains without motion, as the external friction is very much greater than the internal, while the neighbouring layers have progressively increasing velocities. Now, for the sake of simplicity we may imagine this system of layers of increasing velocities replaced by a stationary layer in contact at one side with the crystal and on the other with the bulk of the solution uniformly moved by the stirrer. Thus, this stationary layer is a region through which diffusion of the dissolved substance takes place and the rate of solution is determined by the amount of substance which diffuses in unit time through this layer. The quicker the stirring is, the thinner is the stationary layer, the shorter is the distance for diffusion and the greater the rate of solution. Bearing in mind that diffusion and conduction of heat are entirely analogous processes, and that both phenomena follow the same differential equations, we at once arrive at the theory of the blow pipe, by introducing this simplifying conception of a stationary layer of gas on the surface of the heated body immersed in the rapidly moving gases of the flame. We see that the temperature of the solid body depends on the gain of heat by conduction through this stationary layer of gas and upon the equally large loss of heat due to radiation. The quicker the flow of the gas, the thinner will be the stationary layer; the thinner the layer, the greater will be the flow of heat and the higher the temperature of the body. Thus the difference in the velocities of the hot gases at equal temperature accounts for the higher efficiency of the blow pipe.[*]

The study of flames and the process of combustion and the possible uses of the products of combustion constitute a favourite field for a physical-chemical consideration.

Among the processes for utilising the products of combustion in chemical industries the action of generator gas on alkaline solutions stands out. The old method of making oxalic acid was by the action of fused alkalis on wood, and formic acid was got by splitting off of CO_2 from the oxalic acid. To-day these processes have disappeared. Formic acid is obtained by the action of carbon monoxide, in the form of generator gas, on alkali, and oxalic acid is made from formic acid by heating its salts and decomposing them into hydrogen and salts of oxalic acid. Berthelot discovered this action of CO on alkali as long as 50 years ago and has done much research on this subject. His view was that the caustic alkalis combine with CO best in presence of a little water but always at a very slow rate. In order to quicken up the reaction later on CO at high pressure was used and Berthelot's concentrated solutions were replaced by solid alkali. This was developed into a technical process in which wet generator gas under pressure acted upon slowly shaken pieces of solid alkali; but finally it was found more expedient to replace the solid alkali by a dilute solution which has the surprising property at high temperature of acting much more quickly than concentrated solutions. This is the most modern form of the technical process.

This reaction has been studied in my laboratory.[†] The question was first whether the reaction goes on between water vapour and gaseous CO, or between dissolved CO and the constituents of the solution. Experiment proved the latter to be the case. Thus the speed depends upon the concentration of the dissolved CO which is used by the reaction and replaced from the atmosphere above. Under equal conditions of stirring and temperature the speed is strictly proportional to the partial pressure of CO in the gas-room. At low temperatures the reaction is extremely slow, and moderate stirring of the gas and solution is all that is required to keep the solution saturated with CO. Stronger stirring is without influence. Under these circumstances a high concentration of alkali helps to a comparatively rapid chemical change, but the reaction velocity is always far below that required for a technical process. Heating, as usual, increases the reaction velocity very much, and above 100° it becomes difficult to keep the solution saturated with CO by stirring. At 160° to 170° we cannot arrive at a point where stronger stirring would not materially increase the progress of the reaction. In this region of temperature the velocity of reaction meets the technical requirements, provided the absorbing liquid is brought into extremely close contact with the current of generator gas. Concerning the influence of the concentration of the alkali upon the speed of reaction, we find that from 100° upwards solutions containing about 10 per cent. of alkali become more and more marked by a high rate compared with stronger as well as weaker solutions under the same conditions of temperature and stirring. At 160°, for instance, the 10 per cent. solution works 15 times better than a 43 per cent. one. The suggestion that the 10 per cent. solution becomes best intermixed with the gas by the stirrer in virtue of an especially small surface tension is not supported by measurements of this constant at high temperature,* and this point remains unsettled for the present. The older form of the process which works with solid alkali and the newer using the solution are seen now in very close connection. In the older form the gas used in a wet state produces by virtue of its water vapour a thin coating of concentrated solution of caustic alkali on the surface in which the CO dissolves and reacts as it does in the new process. Perhaps this industrial application illustrates very effectively the influence of temperature and stirring upon reaction velocity. Is it not remarkable that the same alkali which helps us so often to separate CO_2 from CO by the formation of carbonate in gas analysis is able under other conditions to separate perfectly the CO from the nitrogen of the generator gas?

Returning to the subject of flames we find that there is to-day much interest connected with the question of the possibilities of developing their power of fixation of nitrogen. Our usual flames give only very small traces of nitrous products by burning in air at ordinary pressure. In the case of the acetylene flame, which is very hot, a distinct yield can be obtained under ordinary pressure by the combustion with an air enriched with oxygen.† With other gas flames the combined application of air enriched with oxygen and of high pressure in the combustion chamber produces the same effect.‡ The interest in the utilisation of this behaviour for the production of nitric acid results from the fact that the question of fixation of nitrogen is a very burning one. It may be interesting to look more closely into this problem. The more the agricultural conditions in the world develop in such a way that the agricultural products are not used in the place of their growth, the greater becomes the necessity for the addition of fixed nitrogen to the soil. Plants take up fixed nitrogen from the soil and animals get it from the plants, both without increasing or decreasing its quantity; but if corn and meat are exported from the place of production, the ground does not regain the nitrogen which it has given up.

It is true that there is a certain natural replacement of nitrogen. First in the track of lightning free nitrogen is fixed to a certain extent and the rain carries it down from the atmosphere into the soil. Besides this there are in the soil nitrifying bacteria which transform free nitrogen into the fixed state. But they are very sparsely distributed, and there seems no way of increasing their number. The earlier rational agriculturist made use of the special property of leguminosae which grow nitrifying bacteria on its root nobules. These natural aids are now insufficient. The yearly deficit in fixed nitrogen is characterised by the fact that the world's demand for fixed nitrogen amounts to three-quarters of a million tons, by far the largest consumer being agriculture. Nowadays, this requirement is supplied mostly from two sources: the main bulk from the Chilian fields in the form of saltpetre and a smaller part from coal in the form of ammonium sulphate. A few years ago anxiety arose whether the Chilian fields would be sufficient to meet the ever increasing demands for more than a few years to come. To-day we are confident that they will last at least till to the middle of our century, even at the present rate of increase of demand. But when we are told that the Chilian factories have replaced their old and primitive methods by new and very efficient ones and at the same time see that the price continues on its upward course, we realise that the richest and most accessible seams have been exhausted. Therefore the economic future does not look very cheerful, unless a powerful rival steps in.

In regard to the natural store of nitrogen in coal which averages a little over one per cent., it is obvious that it is completely lost in burning and only to a small extent, say one-fifth, regained in coking when by-product ovens are used. In Germany these are almost universal. Here in England the older beehive type, which loses the whole nitrogen, has so far not been completely replaced, and in America up till now they are only employed to a small extent. Though the beehive oven will without doubt be universally replaced owing to this saving of fixed nitrogen, the increase of the supply of fixed nitrogen that is to be expected from this substitution will meet the increase in demand only for a very short time. These circumstances afford a tremendous stimulus to chemistry in its efforts to fix nitrogen, of which we have a limitless supply in the atmopshere. Elementary nitrogen is everywhere at our disposal. Its separation from oxygen is brought about by various methods which only cost something like a farthing per kilo. Against that, fixed nitrogen in the form of Chile saltpetre or ammonium sulphate from the by-product coke ovens has a value of more than a shilling a kilo. This price gives a very high working-margin and makes possible and practicable quite a number of chemical fixation processes. Now, this is not the first time chemists have tackled this question. When Solvay's soda process came with its demand for ammonia Ludwig Mond attempted to solve the question. He took the lines suggested by Bunsen and Playfair and followed in the steps of Margueritte and Sourdeval, by heating together coal, nitrogen, and barium carbonate for the production of cyanide which can be decomposed into ammonia. But Mond gave up this process after a detailed study. He returned to the supply of fixed nitrogen in the coal, and increased the yield to 70 per cent. by the introduction of what is known now as the Mond gas process. This process is continually spreading, as a market is found for the gas of low calorific value which is the other product of the process. In view of this development we may ask what modern aids allow us to carry through with success the task abandoned by Mond and to find satisfactory methods for the fixation of atmospheric nitrogen on a large scale. The answer is obvious if we consider the various processes which have lately been introduced into the technical world.

First of all, we must mention processes which make use of electric energy on a large scale. The first process imitates the example of nature which produces nitrous products in the track of lightning from the nitrogen and oxygen of the air, by producing a high tension arc in a closed vessel through which air is passed. The foundation of this ingenious method has been laid here in England. Cavendish was the first to get nitrous products from air by help of the spark. Sir William Crookes recommended the use of the high tension arc. Lord Rayleigh and later on McDougall and Howles determined the yield under varying conditions. The technical forms which have risen to importance are connected with the names of Birkeland and Eyde, Pauling, and Schönherr. They have in common the conception that the technical process must be based upon the use of large amounts of air and electric energy in one single arc flame, and that this problem can only be successfully solved if the discharge is spread out. For this enlarging of the arc Pauling uses a stream of air moving at a high velocity which is blown against the point where the arc strikes between narrow electrodes. Birkeland and Eyde gain the same effect by a strong magnetic field. Schönherr ingeniously uses a steady column of discharge of many metres length which is produced and kept steady by an ascending whirlwind of air, which surrounds the arc. Factories have been started at different places, on the largest scale in Norway. They rapidly captured the small market for nitrites, but in the large field of nitrates the production has not come up to expectations. The obstacle that hampers this industry is the fact that the production of fixed nitrogen referred to the kilowatt-hour does not exceed 16 grms., and that this small yield is only obtained in the form of gases containing no more than 2½ per cent. of nitric oxide. These unfavourable results are due to the fact that the thermodynamic equilibrium between $N_2.O_2$ and NO has an unfortunate value at all accessible temperatures. The importance of this equilibrium has been pointed out by Muthmann and Hofer, and exact figures for the equilibrium have since been estimated in a very ingenious way by Nernst. The following table gives the percentage amount of nitric oxide which according to him characterises the equilibrium :—

TABLE I.

Percentage amount of NO in equilibrium with air.

% NO		°C.
0·1	....	1230
0·5	....	1660
1·0	....	1930
1·5	....	2140
2·0	....	2300
3·0	....	2590
4·0	....	2840
5·0	....	3060

It is obvious that even at the temperature of the arc only a small fraction can combine with the oxygen unless we may surpass the thermodynamic equilibrium by direct transformation of electric energy into chemical energy. Now experiments carried out in my laboratory have proved that to be possible with small arcs,* but there is not much hope of doing so under technical conditions. The upshot of this is that this electric fixation of nitrogen grows up only at places where exceedingly cheap power is available. This is not the case in the chief industrial countries. Conditions are more favourable in the case of the process of Frank and Caro. They fix 50 grms. of N_2 by use of 1 kilowatt-hour, everything included. The electric power is used in this case for the purpose of making CaC_2 from CaO and coal, the CaC_2 being able after an initial heating to form spontaneously the so-called calcium cyanamide. There are 36,000 tons of N_2 fixed yearly by this method. The calcium cyanamide can either be used as a fertiliser, or split up by steam with the production of ammonia.

A similar amount of energy is said to be necessary in the Serpek process, which apparently is not yet commercially working on a large scale. It is based upon the change of aluminium oxide with carbon and nitrogen into aluminium nitride. Electrical energy is here required, as in the processes mentioned before, for the production of the temperature necessary for rapid reaction. Starting from bauxite and treating it according to the well-known Bayer process to produce the alumina, the Serpek process may be introduced as the first step with the result that the valuable ammonia is obtained as a by-product.

We see that all these processes owe their success to the use of electric energy. The high tension arc requires an extravagant amount and the two other processes require, though much less, still a considerable amount. On closer inspection we find that this fact is the reflex of the values, which the underlying thermodynamic equilibria possess. In the reaction, $N_2+O_2=2NO$; the right side of the equation which contains the desired fixed nitrogen is thermodynamically less favoured than in the reactions, $Al_2O_3+6C+N_2=2AlN+6CO$; and $CaO+3C=CaC_2+CO$; $CaC_2+N_2=CaCN_2+C$. But in all three cases the reaction would, in virtue of its thermodynamical properties, never proceed spontaneously at low temperature. High temperature produces the chemical forces required.

In consequence of that, electric energy can be replaced theoretically by other means of obtaining high temperatures. That is the reason why the question of application of flames comes in for the production of nitric oxide from air. But it is clear that the values of the equilibrium between N_2,O_2 and NO which are so unfavourable even at the temperature of the arc will be a still greater obstacle at the lower temperatures of flames and explosions. The subject has been studied for some time in my laboratory. To give an example we arrived at one molecule of NO with production of 16 molecules of carbonic acid from carbon monoxide. But such results are only obtainable by a large use of the comparatively expensive oxygen to enrich the air and increase the combustion temperature.

Certainly there are enough examples of chemical processes which work successfully on a large scale in spite of the fact that the chemical forces under ordinary conditions are striving to produce the reverse change, from the final products back to the raw materials. The ammonia soda process is an outstanding example. It produces calcium chloride and soda which if simply brought in contact would return to the original form of sodium chloride and calcium carbonate. But in general those reactions are more easily converted into technical processes which are backed by chemical forces tending to change the raw materials into the desired products.

This consideration led our attention some years ago to the reaction of nitrogen and hydrogen to form ammonia. The heat of combination has, according to thermochemistry, a positive value, which proves that it is only due to lack of reaction velocity that the gases do not unite at ordinary temperature. It is true that these favourable values of chemical forces become most unfavourable with increasing temperature. It does not need a very high temperature to make the thermodynamical value of the equilibrium a marked hindrance for any appreciable production of ammonia from its elements. Theory teaches us and experiment has proved that the best mixture of N_2 and H_2 for the production of NH_3 has the value of 1 : 3. But with this most favourable mixture the limit of percentage of NH_3 attainable under ordinary pressure is at higher temperatures very small, as will be seen from the first column of this table :—

TABLE II.

Percentage amount of NH_3 in the equilibrium of the reaction $N_2+3H_2=NH_3$.

Pressure in atmospheres	Temperature °C.				
	550°	650°	750°	850°	950°
1	0·0769	0·0321	0·0159	0·0089	0·0055
100	6·70	3·02	1·54	0·874	0·542
200	11·9	5·71	2·99	1·68	1·07

Especially as the temperature approaches the value of 1000°, for which we easily found effective catalysts, the yield is minute. Some hundred degrees below, the much larger though still small amounts given in the table were formerly inaccessible because of the lack of catalysts effective in the neighbourhood of 500°.

At first sight one might think that the thermodynamic situation is still worse for the synthesis of ammonia than for the combination of N_2 and O_2, because the values of the equilibrium content of NH_3 are much smaller than those for the equilibrium content of NO in air given before. But theory shows a way out of this difficulty in the case of ammonia which is not open in the other case. The NO equilibrium is independent of pressure because the number of molecules is the same on both sides of the equation. In the case of ammonia, however, the number of molecules decreases from 4 to 2,

$$\underbrace{N_2+3H_2}_{\text{4 molecules}} = \underbrace{2NH_3}_{\text{2 molecules}}$$

and therefore according to thermodynamics the attainable percentage of NH_3 in equilibrium is proportional to the working pressure over a wide range. Consequently the values of the equilibrium percentage at 100 or 200 atm.

* See Haber und Koenig, Zeitschrift für Electrochemie, **13**, 725 (1907); **14**, 689 (1908); **16**, 789 (1910). Holwech und Koenig, Zeitschrift für Electrochemie, **16** 803 (1910).

pressure shows a very different aspect, as will be seen from the second and third columns of the table.

It is obvious that technical synthesis is possible if we can succeed in reaching the equilibrium at such pressure and in a short enough time. The current of N_2 and H_2 must circulate in such a way that the ammonia formed by the passage over the catalyst is removed by absorption or cooling before it again passes, mixed with fresh supply of reacting gases. This is the method that was carried through first on a small scale and is now being applied on a large scale. It was necessary to get familiar with the technique of reaction in flowing gases at high pressures. Then catalysts had to be found and studied. The task was somewhat troublesome and I cannot emphasize enough the valuable aid of your countryman Robert Le Rossignol, who was working with me on this question.* Earlier experiments had given us the idea that the elements of best catalytic power for producing ammonia from the gases are akin to our first catalysers manganese, iron, chromium and nickel. Thus we tried the metals of the three last groups of the periodic system till we hit upon osmium and uranium. The osmium proved very effective, if used in a very finely divided state which is easiest obtained by heating osmyl-diamine chloride. The uranium is advantageously used in the form of carbide which in the current of nitrogen and hydrogen changes into nitride which forms a very highly catalytic powder. With these contact substances it was found possible to work in the temperature region of 500° to 600° at high pressures, so that the equilibrium was nearly maintained with a high rate of flow of the gas. The very high pressure limits the space which may be filled with the catalyst. But more than 1 kg. of ammonia is easily produced per hour for each litre of catalyser space. The reaction itself produces the necessary heat because 13,000 gr. cal. are set free in this range of temperature by the formation of 1 gr. equivalent of ammonia from the elements. The Badische Anilin and Soda Company have taken over and further developed our results. Starting from the observation that contaminations in certain cases increase the catalytic activity in such heterogenous reactions, they have been able to raise the activity of poorer catalysts to that of osmium and uranium. The result was only obtained after a careful study of the influence of small impurities, some of which are useful while others, even when present in the smallest traces, act as poisons. They overcame certain difficulties in the construction of high pressure furnaces which became apparent by prolonged working. They developed the purification methods for the hydrogen which became necessary with the replacement of our electrolytic gas by the impure hydrogen from coal. It seems that the task of managing the process on the largest scale has now been carried through satisfactorily.

Reviewing the whole question of the fixation of nitrogen from an economic standpoint, stress must be laid upon the fact, that there is no reason why all these processes mentioned should not flourish at the same time. The demand is so large that all the efforts in the different directions will certainly not meet it for some time. Considering the subject from the technical point of view the progress compared with Mond's result is obviously due to the introduction of high temperatures and high pressures: *i.e.* new physical aids. But looking into the matter from the general standpoint we recognise that the thermodynamic equilibrium questions play the deciding part. Theoretical consideration never replaces experiments, but points out and circumscribes the field in which experiment will probably be fruitful.

There is still a large field to be covered by applied inorganic chemistry, and I trust that the combination of experimental skill in chemical work with physical thinking will lead technical chemists to great results.

THE FIRE-DAMP WHISTLE.

At the conclusion of the Lecture, Prof. Haber gave the following account of his fire-damp whistle, illustrating his remarks with a practical demonstration of the instrument.

Endeavours have been made for a long time to invent forms of apparatus which will reveal the presence of fire-damp in coal mines. Amongst people who have a practical acquaintance with the subject there exists a consensus of opinion that such instruments can be of real service only when they are of such a small and handy form that the miners can carry them and use them conveniently. Practical people are also unanimous in the opinion that the miner is not in a position to employ a measuring apparatus, but that he must receive from the instrument in question a distinct *signal*, enabling him to recognise the presence of fire-damp and approximately estimate its amount. The Davy safety-lamp satisfies these conditions, inasmuch as it yields a direct signal and one which enables the miner to estimate roughly the amount of fire-damp present. A Davy's safety-lamp fed with benzine and with its wick turned down exhibits in air containing methane an aureole round the flame, which is visible as soon as the proportion of methane reaches 1½ per cent., and which increases rapidly in size and visibility as the proportion of methane increases. So far as the recognition of methane is concerned this apparatus satisfies all the requirements of the practical miner. It has however the serious defect that the indicator employed is a flame, which under certain circumstances can ignite the fire-damp. Statistics prove that such a danger is really present, since they show that more than one-half of all the fire-damp explosions occurring in coal mines are due to ignition of the fire-damp by the lamps. This is the reason why endeavours are being made to obtain another sort of fire-damp indicator. So long as the flame of the Davy lamp is employed for the purposes of illumination so long will it naturally be used as an indicator of fire-damp. Since however the employment of portable electric lamps has become possible the necessity for another form of danger signal has been felt.

The "Fire-damp Whistle" is an instrument for detecting by acoustic means the presence of fire-damp. The idea of employing an acoustic apparatus for this purpose was first broached by your fellow-countryman, Professor Forbes, in 1880. His suggestion has been followed by several others, but none of them has met with acceptance by practical miners. The reason for their failure is to be found in the fact that the proposed apparatus did not take the form of small, handy and portable instruments, and that they were ill-adapted to withstand the rough usage of daily work in coal mines. Recourse was therefore had to other means, but it is very difficult to suggest any principle which possesses such great advantages as the acoustic one. If methane were not at ordinary temperatures so chemically sluggish one might employ its chemical reactions for the purpose in hand. Methane reacts, however, with sufficient rapidity only at high temperatures, and the high temperature involves the possibility of that ignition which one must at all costs avoid. Led by these considerations Dr. Leiser and I have endeavoured to develop the acoustic method. The fire-damp whistle which I show you here is the result. As you see, it consists of a brass cylinder 25 cms. long and 6 cms. in diameter. Inside the brass cylinder are two small pipes which are tuned to give the same note in air. They are blown by one and the same current of air, which is provided by a hand pump. This hand pump is simply the outer sleeve of the brass cylinder. Both pipes are provided with membranes, which prevent the operating air current from entering the pipe-tubes (resonators). The space beyond the membrane forms therefore, in the case of each pipe a closed gas chamber, the nature of the gas contained in which determines the pitch of the note given by the pipe. In the case of one pipe the gas chamber is filled with pure air outside the mine, this air remaining unchanged during the sojourn in the mine. Into the closed chamber of the other pipe can be brought the air of the mine, purified from dust, moisture, and carbon dioxide by a cartridge of soda lime. If the mine air contains methane then on sounding the two pipes by means of the sleeve-pump beats are heard whose frequency increases with the proportion of methane in the air of the mine. The beating of the notes of the two pipes produces a characteristic "trill" when the methane content approximates to the explosion limit.

Meeting held at Burlington House, on Monday, January 5th, 1914.

PROF. W. R. HODGKINSON IN THE CHAIR.

MONAZITES FROM SOME NEW LOCALITIES.

BY SYDNEY J. JOHNSTONE, B.SC. (LOND.). SCIENTIFIC AND TECHNICAL DEPARTMENT, IMPERIAL INSTITUTE.

The mineral monazite is composed essentially of phosphates of the cerium and lanthanum earths, but also contains invariably a certain proportion of thoria, and hence forms the principal commercial source of the thorium nitrate employed in making the mantles used for incandescent gas lighting.

Monazite crystallises in the monoclinic system, and varies in colour from pale yellow to dark reddish brown or occasionally black. Its specific gravity is usually about 5·2 but sometimes samples are met with, such as those described later on from Ceylon, having a specific gravity of nearly 5·5.

A large proportion of the monazite used industrially is obtained from deposits in Brazil, where the annual production of sand containing 90 per cent. of monazite exceeds 6000 metric tons. The most extensively worked deposits in Brazil are the naturally concentrated sands on certain parts of the sea coast, and the monazite separated from these, contains on the average from 5·0 to 7·0 per cent. of thoria. The less important deposits inland yield monazite containing from 4·0 to 5·7 per cent. of thoria.[1]

During the past two years an important contribution to the world's production of monazite sand has been made by the native State of Travancore in India. The output in 1911 amounted to 811 tons valued at £24,044 and in 1912 this had increased to 1,135 tons valued at £41,419.

In the course of the mineral surveys conducted in recent years in connection with the Imperial Institute in Ceylon, Southern Nigeria, Northern Nigeria, and Nyasaland, many concentrates have been obtained which proved to contain monazite. The occurrence of this mineral had not previously been recorded from these countries, and particulars of the occurrences will be found in the official reports on these surveys which are published periodically in the Miscellaneous Series of Colonial Reports (London: Wyman and Sons). Similar concentrates have also been received at the Imperial Institute from Travancore and from Malaya. Analyses of monazites from all these sources have been made.

The materials received at the Imperial Institute have been mostly in the form of sands already concentrated by washing. They contained numerous minerals other than monazite, and in such cases the monazites were separated from the concentrates by electro-magnetic[2] or electrostatic[3] means. In a few cases, the monazite examined consisted of a single fragment weighing several grams.

Method of analysis.

The results given in this paper have been obtained by the method outlined below which has been arranged so that the complete analysis, with the exception of the determination of the phosphoric acid, can be performed, if necessary, on one portion of the specimen.

The general principles involved in the methods of estimation used are not entirely new, but the general scheme has been evolved by the author and has been carefully tested during a period of over five years. The methods used may be briefly described as embodying Glaser's[4] oxalate method for the separation of the rare earths, Fresenius and Hintz's[5] thiosulphate method for the separation of thoria, and Mosander's chlorine method[6] for the separation of ceria.

One to two grams of the monazite was finely ground, the loss on ignition determined and the residue digested with 5 c.c. of concentrated sulphuric acid for 2 to 3 hours. After cooling, the syrupy mixture of sulphates was poured into 100 c.c. of cold water and allowed to stand for half an hour. Heating at this stage to accelerate solution is inadvisable, as it sometimes causes the precipitation of a more hydrated thorium sulphate. After being filtered off and washed, the insoluble residue was again digested with sulphuric acid, washed, ignited and weighed. The silica in this residue was estimated by evaporation with hydrofluoric and sulphuric acids and the residue then remaining, which rarely exceeded 0·1 per cent., was examined separately for bases.

Total rare earths.—The combined sulphuric acid filtrates were made up to about 600 c.c., nearly neutralised with ammonia, acidified with about 10 c.c. of hydrochloric acid, and the rare earths precipitated by ammonium oxalate. After standing for 12 hours the rare earth oxalates were filtered off, ignited, re-dissolved, re-precipitated, and after standing, again filtered and well washed with a 1 per cent. solution of ammonium oxalate acidified with hydrochloric acid. The precipitate, after thorough ignition, was weighed as "total rare earths."

The filtrates from the oxalate precipitation were examined for further traces of rare earths, by evaporation nearly to dryness with nitric acid, solution of the residue in hydrochloric acid and precipitation in small bulk with ammonium oxalate. Any rare earths found were re-precipitated and added to the quantity found above.

Iron, aluminium, calcium and phosphoric acid.—The filtrate from the precipitations with ammonium oxalate was treated by Glaser's method (*loc. cit.*) for the estimation of iron aluminium, calcium and phosphoric acid (see p. 56).

Thoria.—Much work has been done during recent years on the estimation of thoria, and criticisms of several of the more important methods published have been made by Metzger.[7] The modification of the method of Fresenius and Hintz, employed by the author, has been used by him during the past five years with satisfactory results, and this method is essentially the same as the one adopted by buyers of monazite sand for industrial use. The "total rare earth" oxides obtained as described above were dissolved in hydrochloric acid, the solution diluted to 200 c.c. and heated to boiling; it was then nearly neutralised with ammonia, about 5 grams of sodium thiosulphate added, and boiled for half-an-hour. After standing at a temperature just below boiling for 8 to 10 hours, the precipitated basic thorium thiosulphate was filtered off, washed, dissolved in strong hydrochloric acid, and after nearly neutralising, re-precipitated by sodium thiosulphate. This precipitate was dissolved in hydrochloric acid and after filtering from the sulphur was precipitated as oxalate and weighed as thoria (ThO_2). In order to recover the small amount of thoria which sometimes passes into the thiosulphate filtrate it was found necessary to evaporate the solution with nitric acid. The rare earths were then precipitated as hydroxides, dissolved in hydrochloric acid and again treated with sodium thiosulphate, the thoria obtained being added to that already found. It was found that the recovery of the rare earths from the thiosulphate filtrate by precipitation with ammonia, as recommended by Metzger,[8] was in some cases incomplete unless the thiosulphate had been previously decomposed by means of acid.

Yttrium earths.—The total thiosulphate filtrates were evaporated to a low bulk and the thiosulphate destroyed by nitric acid as before. The solution was evaporated to dryness, the residue dissolved in a few c.c. of hydrochloric acid, diluted, and the remaining rare earths precipitated as oxalates. The precipitate was carefully washed free from sulphates, ignited, dissolved in concentrated hydrochloric acid and evaporated to dryness on the water bath. The residue so obtained was dissolved in 5 c.c. of water and about 200 c.c. of a saturated solution of potassium sulphate added, together with 5 grms. of finely powdered solid potassium sulphate. After standing for 12 hours, with occasional agitation, the precipitate of double sulphates of potassium with the cerium and lanthanum earths was filtered from the soluble yttrium earth sulphates and washed with a saturated solution of potassium sulphate. This precipitation was repeated on the insoluble sulphates. The yttrium earths in the combined filtrates were precipitated by a slight excess of ammonia, filtered, re-dissolved in hydrochloric acid, precipitated as oxalates and weighed as yttrium earth oxides (Y_2O_3, etc.).

[8] Metzger (*loc. cit.*).

Ceria, lanthana, etc.—The precipitated double sulphates obtained as described in the preceding paragraphs were transferred, with the filter paper, to a beaker and boiled with 400 c.c. of water and 5 c.c. of hydrochloric acid until dissolved. The separation of the ceria from the other rare earth oxides present was effected by the following modification of Mosander's method. The earths were precipitated by ammonia, filtered, washed, dissolved in hydrochloric acid and the solution diluted to about 200 c.c. The solution was neutralised with potassium hydroxide and about 2 grams excess added. A current of chlorine was passed through the solution until the cerium had been converted into the hydrated peroxide and the lanthanum and allied earths had passed into the solution, which then reacted acid. The solution, which contained an excess of chlorine, was diluted to 400 c.c., allowed to stand for several hours, and filtered. After washing, the precipitate was redissolved, the potassium hydroxide and chlorine treatment repeated twice and the cerium finally precipitated as oxalate and weighed as the oxide CeO_2.

The filtrates, containing the remaining rare earths, were evaporated to a low bulk with hydrochloric acid, and the lanthanum and didymium earths precipitated as oxalates The precipitate after filtration was decomposed with nitric acid, the earths re-precipitated as oxalates, and after ignition weighed as the oxides, La_2O_3, etc.

Phosphoric acid. As mentioned on p. 55 the phosphoric acid can be determined in the residue remaining after the removal of the rare earths, but it has been found more convenient to carry out this determination on a separate portion of the original sample in the following manner. Half a gram of the finely ground monazite was fused with 5 to 7 grams of potassium carbonate in a platinum crucible for about 2 hours. The "melt" was dissolved in water, filtered, and after washing about a dozen times with one per cent. potassium carbonate solution the insoluble matter was ignited, again fused with potassium carbonate and the treatment repeated as long as any more phosphoric acid was extracted. Usually two fusions were sufficient. The combined filtrates were acidified with nitric acid, the phosphoric acid precipitated first as ammonium phosphomolybdate and finally as magnesium ammonium phosphate and after ignition weighed as $Mg_2P_2O_7$.

The accuracy of the above methods of analysis was tested by the examination of solutions of mixed rare earth salts of known purity. In these solutions the rare earths were present in about the same proportions as they occur in monazite sand. The results thus obtained are shown in the following table :—

TABLE 1.

Rare earth salt used.	Strength of solution.	Volume of solution taken.	Weight of salt taken.	Weight found.		Error.

Loss on ignition	0·59	0·48	0·93	0·20	—
Specific gravity	5·20	5·25	—	5·23	5·47

From these results and numerous partial analyses made at the Imperial Institute it is evident that the Ceylon monazite usually contains about 10 per cent. of thoria, which is nearly double the amount found in the monazite of Brazil. It must be mentioned, however, that as little as 5 per cent. of thoria has been found, by the author, in certain monazite sands from Ceylon, but material of this character appears to be of somewhat infrequent occurrence. Occasionally, specimens are met with having an unusually high specific gravity and a correspondingly high percentage of thoria, which it will be seen has reached over 28 per cent. (column 5 in Table 2). The Ceylon monazite in general is very similar in composition to one of the Norwegian varieties the analysis of which is given in Table 7.

Travancore Monazite.

Two specimens of this monazite gave the following results :—

TABLE 3.

	No. 1. Per cent.	No. 2*. Per cent.
Thoria	10·22	8·65
Ceria	31·90	61·11
Lanthana and allied oxides	28·00	
Yttria and allied oxides	0·46	0·62
Ferric oxide	1·50	1·09
Alumina	0·17	0·12
Lime	0·20	0·13
Silica	0·90	1·00
Phosphoric acid	26·82	26·50
Loss on ignition	0·46	0·45

* Isolated from a concentrate supplied by Mr. I. C. Chacko, B.Sc., State Geologist, Travancore.

These analyses show that the monazite of Travancore contains a high percentage of thoria approaching that of ordinary Ceylon monazite. According to E. White[1] from 6 to 14 per cent. of thoria has been found in Travancore monazite.

Malayan Monazite.

Monazite sand has been found in many localities in the Federated Malay States and the protected States of Kedah and Kelantan in association with alluvial tinstone.[2]

In Table 4 are the results of analyses of samples of typical monazites from this source received at the Imperial Institute.

These results show that there are wide variations in the percentage of thoria in monazite from Malaya, from the Perak specimen containing only 3·4 per cent. to that from Kelantan, which contained over 9 per cent. and is superior in this respect to the average Brazilian material.

Nyasaland Monazite.

The following are the results of an analysis of monazite separated from a concentrate obtained from a stream at Namalundo Hill, near Chiromo, in the Nyasaland Protectorate :—

* Isolated from concentrates supplied by Mr J. B. Scrivener, M.A., F.G.S., State Geologist, Federated Malay States.

From the results of numerous partial analyses made at the Imperial Institute, by the author, on other samples of monazite from Nyasaland, it would appear that the average thoria content is about 6 per cent.

It would appear from analyses Nos. 4 and 5 above that monazite from different parts of the same locality and apparently derived from the same source, may contain widely different percentages of thoria, but further work is necessary to confirm this point, which is of some considerable scientific and commercial importance, particularly as monazite of the grade of sample No. 5 would not repay export to Europe. The above results show that the percentage of thoria in monazite from Nigeria may vary between fairly wide limits. The average thoria content of a large number of Nigerian monazites examined by the author is 5·5 per cent. for those from Northern Nigeria and 5·8 per cent. those from Southern Nigeria. The results show that these monazites, as a whole, are nearly as rich in thoria as those exported from Brazil.

The Constitution of Monazite.

The question of the state of combination of the thoria in monazite has received attention from various investigators.

Penfield[1] has suggested that monazite is a normal phosphate of the cerium earths and that thoria is present as an impurity, probably as the silicate thorite, and supports his view with numerous analyses, which show the ratios $(Ce,La,Di)_2O_3 : P_2O_5 = 1 : 1$ and $ThO_2 : SiO_2 = 1 : 1$. He also reported the occurrence in monazite of a substance which appeared "resinous" under the microscope and which he considered to be thorite. This view is supported by evidence adduced by Rammelsberg,[2] Dunnington[3] and others. Blomstrand,[4] on the other hand, considers that the mineral is a normal tribasic phosphate and that the excess of bases is combined with silica thus :—

$$m(3RO,P_2O_5)+2RO,SiO_2+pH_2O$$

where m may vary from 5 to 20 and p is less than 1. He does not support Penfield's thorite theory, but considers rather that thoria is a primary constituent of the mineral, occurring as phosphate in isomorphous admixture with the cerium phosphate. He attributes the presence of silica to alteration by silicious waters.

Kress and Metzger,[5] from a consideration of numerous partial analyses of monazite from Norway and North Carolina, conclude that thoria is present as phosphate and that the silica belongs to some unidentified silicate other than normal thorium silicate, but in almost every case they record percentages of silica which increase with those of the thoria. They could not detect the presence of the "resinous" constituent mentioned by Penfield.

In considering this question in relation to the analyses now presented, it is evident that those made on sand grains cannot be considered owing to the risk of inclusion, in the sample examined, of quartz in minute particles or dust. In these circumstances the only analyses in this communication available for discussion are those made on massive monazites from Ceylon. When these analyses are considered in relation to the views quoted above it is evident that they do not support Penfield's theory, for in no case is there sufficient silica present to combine with *all* the thoria to form the normal silicate ThO_2,SiO_2.

As regards the theory of Kress and Metzger (who do not support their conclusions by complete analyses) that the thoria is all present as phosphate, the analyses given in this paper do not show sufficient phosphoric acid to combine with the remaining cerium earths. Thus it would have to be concluded, if the theory of these authors be adopted, that part of the cerium earths is present as silicate or as oxides and on this point, at present, no evidence is available.

An attempt was made to detect the presence of thorium silicate in monazite by taking advantage of the fact that thorite, when reduced to the same state of subdivision, is more readily soluble in hot concentrated nitric acid than is monazite. 1·8 gram of finely ground Ceylon monazite containing 10 per cent. of thoria was heated for half an hour with concentrated nitric acid and the rare earths estimated in the filtrate. The experiment was repeated, using concentrated hydrochloric acid in place of nitric acid. The following is a summary of the results obtained :—

	Weight of rare earths in solution.	Weight of thoria in solution.	Ratio of thoria to rare earths extracted.	Ratio of thoria to rare earths in mineral.
	gram.	gram.	per cent.	per cent.
Nitric acid	0·1130	0·0223	19·7	14·03
Hydrochloric acid	0·2200	0·0390	17 7	14·03

These results indicate that the thorium constituent is slightly more readily attacked by concentrated acids than the cerium earth phosphates, but the difference is not sufficiently great to make an efficient separation possible. The results indicate, however, that there is in monazite a thorium constituent which is more readily soluble in nitric or hydrochloric acid than the cerium earth phosphates.

Further experiments showed that natural hydrated thorium silicate, in the form of the mineral thorite, shows practically no difference, as regards its behaviour with acids, from ignited artificial thorium and cerium phosphate.

It does not appear likely that experiments designed to separate thorium silicate from thorium phosphate and cerium phosphate will, even if successful, prove of general application to monazite, as experiments have shown that the solubility of thorite in acids is to a very large extent dependent on the state of hydration of the mineral. Thorites containing from 2 to 6 per cent. of combined water are attacked by nitric acid with the greatest difficulty, whilst those containing over 8 per cent. of water are readily decomposed.

From the results of the analyses given in this paper it is seen that the combined water in monazite varies between 0·2 and 1·2 per cent.

It would therefore appear that if the problem is to be attacked from a solubility standpoint it would be necessary to consider the relative rates of solution of cerium phosphate and silicate and of thorium phosphate and silicate in nitric acid. Unfortunately, the available minerals containing these compounds occur in various degrees of hydration and are therefore not of service in this connection.

The author is indebted to Mr. G. S. Blake, B.Sc.(Lond.), A.R.S.M., for the analysis of sample No. 1 in Table 2, and to Mr. J. Shelton, F.I.C., for the analysis of sample No. 4 in Table 4. Thanks are also due to Mr. G. M. Davies, B.Sc. (Lond.), F.G.S., for the separation from the crude sands of the monazites dealt with in this paper.

Discussion.

Mr. E. **White** said that the figures for the thorium contents which were given in the books had to be regarded with suspicion. The earlier figures were of very doubtful accuracy before they were standardised and brought down to the present condition of knowledge. Mr. Johnstone had referred to his figures for the analysis of monazite from Travancore. It was true that the highest was 14 and the lowest 5 or 6 per cent. of thorium oxide, but the most remarkable specimen which had come under his notice was one from South Africa in the massive form, which although perfectly free from other minerals contained only about 1½ per cent. of thorium oxide. The Nigerian samples were interesting, but he understood that transport was difficult, so that unless a mineral was very rich it was not of commercial value in Europe on account of the freight. Serious efforts were being made to find some outlet for the other rare earths which were present in monazite sand. The use of cerium alloyed with iron in pocket pipe lighters appeared to provide an outlet for a large quantity of cerium, which was obtained as a by-product in the manufacture of thorium. A comparatively small quantity of cerium was used for medicinal purposes. Efforts were being made to utilise cerium on account of its forming two oxides, but at the present time it had not found very much use in that direction, and he believed that about three-fourths of the cerium remained practically unused.

Mr. W. F. **Reid** said that many years ago he was investigating the minerals of the Argentine Republic for the Government there, and, among other things, examined a number of sands. His party was driven by stress of weather out of the Argentine on to the Uruguayan coast, which was just opposite on the River Plate, and there he found a lot of pink sand in layers. He had kept samples weighing four or five pounds, and had quite recently handed them over to an expert, who had found a considerable proportion of monazite, zircons, and other minerals. The supply was almost inexhaustible although it could not be obtained all at once. There was hardly any tide, but there were frequent rises of the river, and whenever it rose the water left a pink blush on the sand. It was this pink sand that contained a considerable percentage of monazite. Whether it would be remunerative to work or not he did not know. The best samples were from Punta Caballos, on the Urugrayan bank.

The **Chairman** said that the presence of such a quantity of lanthanum was interesting. There was a great deal to be done in connection with the so-called rare metals and their alloys. In the case of cerium, the iron-cerium alloy seemed to be the only practical one at present, although other metals would alloy with cerium.

Mr. **Johnstone**, in reply, said that he strongly endorsed Mr. White's remarks regarding the unreliability of certain of the older analyses of monazite, both on account of the methods used for the determination of thoria and the impurity of the sample examined. He thought it was highly desirable that the method of analysis of rare earths and the purity of the sample examined should be stated clearly. He had found on record analyses of supposed pure monazite which included several per cent. of zirconia and oxides of tantalum and tin; obviously those were not samples of pure monazite.

THE ELECTRICAL CONDUCTIVITY OF MILK DURING ITS CONCENTRATION, WITH SUGGESTIONS FOR A PRACTICAL METHOD OF DETERMINING THE END POINT IN THE MANUFACTURE OF SWEETENED CONDENSED MILK.

BY LILIAS C. JACKSON, LESLIE McNAB, AND A. C. H. ROTHERA.

(Biochemical Department, University of Melbourne.)

The electrical conductivity of milk is determined by two sets of opposing factors; (1) the carriage of electrical charges by the ionised salts, and (2) the resistance offered by the proteins, fat, sugar, colloidal calcium phosphate, etc. In normal fresh milk the non-ionised salts, sugar, protein, and fat diminish the conductivity value by 12 per cent., or thereabouts. The effect of the protein alone, which has been accurately estimated, is 2·56 per cent. of the conductivity value for every 1 per cent. protein present in the milk.

It is therefore of interest to determine what is the effect on the conductivity, of concentrating the milk. Since the degree of ionisation becomes less on concentrating the salts, and the obstruction offered by the other solids becomes very great, it is almost certain that, with increasing concentration of the milk, there will be a gradual diminution in the increase of electrical conductivity, and ultimately a reversal, when the electrical conductivity will decrease for a further increase in the concentration of the milk.

In a series of experiments, 500 grms. of separated milk was concentrated at a temperature not exceeding 40° C. in a large distillation flask, fitted with condenser, and exhausted by an ordinary water pump. The electrical conductivity of the milk was measured at intervals. Following are the results of one such experiment:—

October 20th, 1911. Separated morning's milk (500 grms.): Total solids, 9·17 per cent.; sugar, 6·30 per cent.; fat, 0·35 per cent.; protein, 2·67 per cent.; ash, 0·80 per cent. Electrical conductivity, K=0·00570.

Sample.	Weight of concentrated milk.	Calculated solids.	Electrical conductivity.
	grms.	per cent.	
I.	223	20·21	K=0·00903
II.	203	22·21	K=0·00946
III.	172	26·15	K=0·00978
IV.	163	27·68	K=0·00983
V.	153	29·53	K=0·00978
VI.	126	35·86	K=0·00946

The turn in the conductivity values comes with sample IV., containing 27·68 per cent. total solids, and 8·01 per cent. protein.

The following is a summary of five such experiments all performed with the milk from the same cow. The figures are for the turning point in the conductivity values.

	Total solids.	Protein.	Electrical conductivity.
	per cent.	per cent.	
Oct. 13th—Morning	29·58	—	K=0·00912
Oct. 17th—Morning	27·36	8·4	K=0·00827
Oct. 20th—Morning	27·68	8·01	K=0·00983
Oct. 27th—Morning	29·43	7·86	K=0·00956
Oct. 30th—Evening	32·80	9·55	K=0·00992

It may be said that the maximum electrical conductivity is obtained when the separated morning's milk is concentrated to 28 per cent. total solids with 8 per cent. protein. The evening milk gives higher figures.

The actual total solids and protein were not determined in the condensed samples, the figures being obtained by calculation. Thus, the measurement of electrical conductivity will be of no value in determining the degree of concentration of a separated unsweetened milk, because the concentration may increase considerably between

25 per cent. and 30 per cent. total solids, with very little alteration of the conductivity.

It is quite different, however, with a sweetened milk concentrated to the degree which is usual in the manufacture of condensed milk. With full fat, and with added cane sugar equivalent approximately to 16 lb. sugar per 100 lb. milk, the reversal of the conductivity comes at the start of the process of concentration. When the concentration reaches the necessary degree for the production of sweetened condensed milk, the electrical conductivity decreases rapidly for each increase in concentration of the milk.

The following experiment will illustrate this point:—26th July, 1913, Bought morning milk. Fat 3·7 per cent. Protein 3·21 per cent. To 562 grms. milk was added 90 grms. sugar, making 652 grms. in all. A sample having been taken for the measurement of electrical conductivity, concentration was commenced on 630 grms. sweetened milk.

	Weight of milk and sugar.	Protein.	Electrical conductivity.
	grms.	per cent.	
Original	630	2·76	K=0·00321
Sample I.	602	2·88	K=0·00321
,, II.	574	3·03	K=0·00323
,, III.	474	3·67	K=0·00321
,, IV.	427	4·07	K=0·00311
,, V.	333	5·27	K=0·00245
,, VI.	293	5·93	K=0·00188
,, VII.	216	8·05	K=0·00034

NOTE.—The protein percentages represent the amount of protein in the combined milk and sugar.

The turning point of the conductivity comes with sample II., when only 56 grms. of water have been removed. Towards the end of the concentration the electrical conductivity decreases most markedly with each further removal of water. Consequently there is the necessary element of sensitiveness, permitting the measurement of the electrical conductivity as an indication of the degree of concentration.

The end point in the manufacture of sweetened condensed milk.

In a report issued during 1912, under the direction of the Local Government Board (England), the author, Dr. F. J. Coutts, says in discussing the control of the concentration process: "The determination of the precise moment at which to stop the condensing process requires skill and judgment"; and after discussing methods employed to determine the right degree of concentration, he adds: "It is not surprising, therefore, that variations exist." Determination of density by the hydrometer is in common use, but is unsatisfactory. The viscosity of the condensed milk makes it difficult to use it accurately. Viscosity measurements have been tried, but are inadequate as a means of determining the amount of concentration. The really accurate method is to condense to a given weight, but this is impracticable on the manufacturers' scale.

It is proposed, therefore, to discuss the measurement of electrical conductivity as a means of determining the degree of concentration, and to outline a method for its practical application.

The manufacturer of condensed milk deals with very large volumes of milk from numberless cows. Individual variations in composition will therefore vanish, and all morning milks will approximate to a standard, except for variations produced by climatic changes, and by the gradual progress of the season. The same will be true of evening milks, though here the general composition will be somewhat richer than with morning milk.

The variations in electrical conductivity of bulk milk from many cows have been determined in Melbourne (Australia) during four months of the year (Nov., Dec., Feb., March) with very great and sudden variations in temperature and humidity. The extreme figures were:

Minimum K = 0·00549. *Maximum* K = 0·00587.

The milks, however, with the higher conductivities were more concentrated milks, obtained during hot dry spells. With added cane sugar they may be looked upon, therefore, as equivalent to the poorer milks of wet cold weather slightly concentrated. On theoretical considerations, then, the turning point in the conductivity figures will come earlier with the richer milks, and so compensate for the fact that they are richer. In fact, the taking of electrical conductivity as a measure of the degree of concentration, will lead to the process being stopped slightly earlier when richer milks are being condensed.

If a direct measurement of the conductivity of the milk in the vacuum pan be made it will have to be corrected for the variations in temperature of the vacuum pan and contents. This correction can, however, be made by employing a resistance, whose variation with temperature shall be the same as the variation in resistance of the condensed milk itself.

This resistance must then be placed in the vacuum pan side by side with the conductivity cell which is being employed to take the resistance of the concentrating milk. The resistance chosen is a closed cell filled with a sample of condensed milk. The ratio of closed resistance cell to open "conductivity" cell, when each is filled with the same fluid at the same temperature, is determined, and it is then known that when this ratio becomes established during a concentration process, the fluid in the open cell (the milk, that is, which is being concentrated) must have the same resistance (and therefore electrical conductivity) as the condensed milk sample in the closed cell.

Naturally the resistance cell would be filled by the manufacturer with what he considers one of his best samples of condensed milk.

The method as just outlined has been tested in the laboratory and found to give satisfactory results on a small scale, the average error in ten experiments being ±0·3 per cent., and the maxamum error ±0·5 per cent. This maximum error, in terms of the percentage of water in the finished condensed milk, would represent a figure of, say, 26·00 per cent. water instead of 26·45 per cent. This is a considerably greater degree of accuracy than is usually obtained in manufacturing practice.

Consequently it may be said that, from theoretical considerations supported by experimental work in the laboratory, there is every reason to think that the measurement of electrical resistance or conductivity should furnish an accurate method of following the progress of concentration in the manufacture of sweetened condensed milk.

If the resistance cell were filled each week with a sample of what the manufacturer considered to be his best product of the previous week, the control of the manufacturing process would be gradually and progressively adjusted to seasonable changes in the milk.

It is hoped that the possibility of using a new and more accurate method in the manufacture of sweetened condensed milk may interest some of those concerned with that industry, and lead to electrical conductivity methods being given a trial in factory practice.

New York Section.

Meeting held at Rumford Hall, Chemists' Building, on Friday, November 21st, 1913.

MR. G. W. THOMPSON IN THE CHAIR.

A PECULIAR DUST EXPLOSION.

BY WILLIAM M. GROSVENOR, PH.D.

A question frequently of great interest is whether what is called a "dust explosion" really is primarily an explosion or primarily a fire followed at some later stage in proceedings by an explosion of some chamber wherein the quantity of reacting materials is sufficient and the products of combustion are sufficiently confined. Combustions of dust and air that result in so-called "explosions" generally begin at such points and create such havoc as to render exact analysis of the various stages of the reaction difficult, if not impossible. What renders this case of peculiar interest is that four excellent observers were present at the start of the trouble—two in fact saw the initiation of the combustion wave—and yet survived to bear witness. Fortunately, also, these men were not handicapped with imaginations, scientific or otherwise, and merely saw what they saw and told the story and stuck to it.

One Sunday morning two men were cleaning out a cylindrical starch dryer preparatory to some repairs. The dryer consisted of a horizontal drum of 2 in. wood, 4 ft. diameter, 20 ft. long, headed at each end, provided at one end with a 12 in. × 16 in. manhole and a 17 in. × 17 in. air inlet, provided at the other with a 17 in. × 17 in. air outlet. It also had a 10 in. inlet for starch on the upper side at one end and a similar outlet on the bottom at the other end. In the axis of this cylinder was a shaft having numerous arms carrying at their outer ends blocks of wood serving as shoes to lift and drop the starch through the hot air, also serving by their angular set to progress the starch slowly along the dryer from the inlet to the outlet end. The dryer being repaired was the lowest of a set of three, one above another, and part of a large installation of several such sets side by side. The three vertically above one another forming a set, were all connected at one end with the hot air supply duct and at the other with the exhaust duct. The various sets all connected to a large common air supply fan and a common exhaust fan. The lowest of the north set (the one being cleaned) stood about 18 in. clear above the floor, and all those involved were located in a 20 ft. × 40 ft. brick walled building—2 storeys factory construction without pillars, and having a heavy plank tar paper and gravel roof. The two cleaners had entered this lower left hand dryer and, owing to a breakdown in the city electric service, had cleaned out most of the starch in the dark. Being well used to the work, they had made a thorough job of it. To make sure that everything was well cleaned, one of them brought an ordinary lantern (against posted regulations) into the dryer, and they went over it again with counter brushes, working from the inlet end toward the outlet, and were almost through when the foreman came into the room by the door A, almost opposite the open manhole of the dryer being cleaned, spoke to his son (a pipefitter), who was lying on his back under the dryer tightening up a fitting, and then poked his head into the open manhole of the dryer and spoke to the two cleaners. The foreman then passed the ends of the other sets and started to open the door, B, to leave the building, when a rushing sound caused him to look around, and he saw a tongue of flame thrusting out from the manhole. He turned about as the tongue extended and started to duck under it, but it reached the wall opposite the manhole, mushroomed out, and he found himself enveloped in an atmosphere of flame through which he reached the door by which he had entered and thus made his escape, though severely burned. The son lying on his back under the dryer first noticed a roll of flame coming down around the side of the dryer cylinder, dropped his wrench, rolled over on his face and crawled out through the door, somewhat burned but not severely. Meanwhile the two cleaners were at the centre of disturbance. When the foreman spoke to them the Italian was squatting at the far end of the dryer facing the end with a counter brush, drawing the last of the starch that had been swept along to that end. The lantern was on the cleaned floor of the dryer at his back about 3 ft. from the end, and the German was standing stooped over the lantern about 5 ft. from the end and between the lantern and the manhole. Just as the foreman left the manhole and proceeded past the ends of the other dryers, the Italian reached his brush up into the inclined air outlet to brush off some starch, and may have knocked down a quantity of fine dust accumulated on the walls of the duct. A cloud of dust fell around his knees and spread back past him to the lantern. The German saw the dust reach the lantern, noticed the particles circulating round and round it, and then, as he put it, "the air all round the lantern took fire," the flame enveloped him and he started for the manhole, climbing over the stirring arms as fast as he could go. The Italian's first sight of the flame wave was as it advanced past his elbow from behind, flowing up the pipe and up around his shoulders and head. He describes its velocity, by movement of his hands, as about 2 ft. a second. He tipped himself over backward regardless of the lantern and, lying on his back, kicked and pulled himself head first the length of the dryer between the arms, started out of the manhole head first, reversed, and came out feet first. Both men describe the atmosphere in the dryer as first a mass of flame for a moment, followed by smoky blackness. These two men were seriously burned, the German most of all. None of the men found any obstruction to his path (except the arms inside the dryer), none heard any noise or explosion or felt any shock or blow, none showed any signs of mechanical injury (other than burns). All could see and hear and speak perfectly, and remained perfectly conscious throughout (although of course confused and uncertain in their purposes and movements after they got out). A passer-by on the railroad track about 150 ft. away felt a push of air, heard a "woof" like a big cough, and glanced over at the building to see the walls and windows jumping out, the roof lifted, and a 10,000 gallon water tank from the corner of the roof jumping bodily out into the lot. The fireman from the boiler house opposite the adjoining corner of the building heard a dull explosion followed by a crash, stepped to the door, and saw the walls down to within 3 ft. of the ground at the corner on which the tank had stood, and sloping diagonally up to points just below the roof line at the two adjoining corners. The dryer in which the men were burned was practically uninjured; the edges of the wooden shoes on the stirrer were slightly charred, as were the edges of the chimes and the manhole. The middle and bottom dryers of the other two sets were damaged, the heads blown out, some of the iron hoops broken and some of the staves cracked. Part of the automatic sprinklers in this room let go by fusion, not breakage, and deluged everything. The floor of the second storey fell on the tops of the dryers and sustained the wreckage of the roof, the mass taking fire, but being quickly extinguished by the sprinkler jets, most of the pipes of which were not broken.* Several pipes, including the big air conduit, fell between the ends of the dryers and the door out of which the foreman passed.

The times required for repeating the various movements of the men in escaping were carefully determined: Foreman, 5—8 seconds; son, 5—8 seconds; German and Italian, 15—20 seconds. The wreckage was carefully examined. No evidence of violence was apparent until the connecting pipes were passed and the flame had reached some chamber that enclosed a considerable volume well supplied with dust, *e.g.* the second storey room into which the rush of air ahead of the flame would have swept much dust from the pipes, or the other dryers covered everywhere inside with dust. The floor of the second storey, as indicated by markings on the ends of the girders, appeared to have been blown downward, the walls outward, most forcibly at the top, but also with some push from the gases in the first floor room. Neither timbers nor bricks were shattered—only broken in falling or pulling apart. At no point was there any evidence of the violence characteristic of the detonative wave, which calculation indicates would be about 6138 ft. per second or the accompanying pressure of 890 lb. per sq. in.

A study was made of the behaviour of the specially fine and dry dust collected from beams and other places where air-levigated material might lodge, and afterward specially dried. It was burned in falling from a hundred mesh screen, and of course burned quietly. The velocity of flame propagation through such a mass could easily be measured with approximate correctness upward or downward, and showed little increment. Burned in a 2-inch glass tube rotated and rapidly tapped, the flame velocity became constant at about 3 ft. per second, slow enough to be easily followed in its progress. Dummy dryers were made of several sizes and sifted starch dust ignited in them by a free flame, and the push of the flame wave roughly determined. In no case was it possible at or near the centre of propagation to get anything approaching an explosion. A No. 8 du Pont detonator failed to give markedly different results exploded in the confined dust in the absence of great quantities of admixed air.

---

* It is perhaps opportune to point out the advantage of true w.i. pipe and malleable fittings for all sprinkler connections.

Let us review the facts. Two men at the centre of propagation suffered no mechanical injury. A third passed through the wave without being knocked down after it had travelled more than 20 ft. All three, some seconds after the initiation of the wave, passed without obstruction through a space which the explosion caused to be obstructed by pipe, etc. Only when the flame passed through conduits for a distance of 20 to 40 ft. and entered well dusted chambers, well-confined for their size, after a lapse of 10—20 seconds did "explosion" occur. Nowhere was the shattering effect of detonation observable, no "crack" was heard, and the only mechanical damage was of the "bursting" variety, found exerted only in chambers above described. The theoretical maximum velocity of the starch air detonating wave, if it were possible to initiate it, is so low as to be less than that of $CH_4+O_3+N_5$, which can barely propagate itself, and goes out sometimes by itself and more like that of $CH_4+O_3+N_{24}$, which burns but cannot be detonated. We were compelled to the conclusion that, for this material at least, explosion in any proper sense was necessarily preceded for some distance and an easily appreciable time by fire consuming the product of manufacture; that explosion finally supervened only as a result of gradual fire, accompanied by the temporary restraint in some container of the normal and gradual expansion of the combustible products, and that explosion actually occurred only when the container walls let go and permitted the sudden and violent expansion of these combustion products.

When the original ignition takes place in a container of large capacity the final effect follows quickly, and the impression conveyed may be that the dust and air mixture "exploded" because the giving way of the container when it explodes follows so quickly upon the fire, but the fire itself is without violence or detonative "crack." In long tight tunnels of large dust capacity it might be possible to create sufficient pressure after prolonged combustion to initiate a detonative wave but, with starch at least, this seems very doubtful both theoretically and from the results of practical tests. It is believed that no so called "starch explosion" can be other than the ultimate explosion of containing walls that have yielded to the gradually though perhaps rapidly accumulated pressure of the combustion products. The same conclusion seems to be justified (theoretically at least) for many other kinds of combustible dusts.

Discussion.

Dr. A. A. **Breneman** stated that almost every explosion presented features of peculiarity, some of which were extremely difficult to explain or understand. It was often necessary to reach a conclusion rather as a choice of alternatives than as a conclusion that could be fixed upon with certainty. It was therefore very interesting to have a record of such an explosion in which practically all stages of the explosion were under direct observation by surviving witnesses, even the first initiation of the flame wave. As to the question whether detonation could occur in dust explosions, he was in some doubt, since in certain coal mine explosions where the flame had travelled over 1000 ft., cumulative pressures and mechanical effects had been observed which seemed to indicate the initiation of a detonative wave. With coal, therefore, the question was still open to discussion, but he was not prepared to speak with regard to starch. One noticeable thing about all dust explosions was the extraordinary heat and consequent inflammatory effects produced by dust explosions as distinguished from explosions of gas mixtures. Whether this was due to the more condensed form of the combustible or to the impingement of the solid particles during the act of combustion, was difficult to say, but it was certainly a fact very generally observed that dust explosions were much more likely to lead to fires than the explosions of gas. One peculiar form of dust, finely divided metallic particles such as aluminium in flash-light powders, remained to be considered. In that case there could not be the transmission of flame by gaseous products evolved from the solid, so that it remained to be proved, either experimentally or by some terrible accident, whether the evolution of gas was necessary in order to account for the transmission of flame in dust explosions, or whether the transmission could take place from solid particle to solid particle.

Dr. L. H. **Baekeland** stated that one possible cause for explosions was always to be considered where a powdered material was being handled, viz., the friction between powder and other solids with which it might come in contact. Within his experience one very serious explosion had been caused by the static electricity generated through the contact of a material flowing down a wooden chute, and all recurrence of the phenomena had been prevented by installing metallic conveying chutes. This point was well recognised by those who happened to have had the experience, but he thought it should be brought to the attention of younger chemical engineers undertaking the design of plants where such material might be evolved.

Dr. W. M. **Grosvenor**, replying to Dr. Breneman, said that one great difference between coal dust explosions and explosions of the usual commercial dusts lay in the fact that coal dust was almost invariably accompanied by more or less gas evolved from the seams which, though it might not be present in large enough quantity to sustain a detonative wave, would of course enormously increase the rate of increment in the flame velocity, and probably serve in many cases to initiate detonation in mixtures of dust and air that would be incapable of reaching a detonating velocity without the presence of the gas. Furthermore, in considering starch particularly it was to be remembered that we were not dealing with the material containing 60 per cent. of combustible, but to some extent the $C_6H_{10}O_5$ molecule was six parts of combustible loaded in advance with five parts of water to be evaporated before combustion temperatures could be reached. This probably accounted for the low calculated velocity of detonation, because it gave a low heat of combustion. Unquestionably dust flames gave every evidence of a heating effect out of all proportion to the actual flame temperature, but it did not seem necessary to assume any considerable contact of the heated dust particles with the walls, nor any peculiar action of the dust particles in promoting a form of Bohn combustion in the gases, because if the precise mechanism of the transmission of heat from the exploding gases to the walls, timbers, or surrounding combustible material were considered, an all-sufficient difference would be apparent. When dealing with a mixture of combustible gases the only method of heat transference available was convection from the thin skin of gas in immediate contact with the wall, and the rise in temperature of the walls would necessarily be slow, however high the temperature of the gases, because it would be necessary continuously to replace by convection the cooled skin in order to raise the temperature of the wall surface. Against this action there would be the conductive capacity of the material constituting the wall, so that some time would be required before the immediate surface of the wall could reach an inflaming temperature. As compared with this the dust explosion presents an enormously greater rate of transfer, because the heated gases were loaded with incandescent solid particles, which, unlike the gases, were capable of transmitting heat at an enormous rate by radiation and transmitting it immediately to the surface of the wall, quickly raising the temperature to the inflaming point before the slow conduction of the wall material would have appreciable effect. For that reason it would probably be found that an explosion of metallic dust once initiated would be self-sustaining, because the radiating power of the dust particles at the front of the wave would be sufficient to raise the temperature of adjoining particles just ahead of the wave to that point where they were quite capable of being inflamed with the surrounding oxygen. It was his recollection that such explosions had occurred.

Commenting on Dr. Baekeland's recommendation, Dr. Grosvenor emphasised the necessity for caution as to the likelihood of explosion due to static causes, particularly in handling di-electric material. In one instance it had been found necessary to clothe completely every part of the machines coming in contact with a di-electric material, with a sort of metal skin, and to provide means like brushes or fixed connections for grounding carefully all of these parts to the water or steam mains.

Obituary.

W. POPPLEWELL BLOXAM.

W. P. Bloxam was born in 1860, and was the son of Dr. William Bloxam. He was educated at King's College School, and later took the B.Sc. degree of London University. Subsequently he became assistant to his uncle, Prof. Chas. Bloxam, at King's College. W. P. Bloxam's first appointment was at the Royal Naval College, Greenwich, where he was for 12 years demonstrator in the Chemical Laboratory. Later, he undertook research work on the anti-toxins, at the College of Physicians and Surgeons, and in 1901, he was sent to the Presidency College, Madras, as Professor of Chemistry. From Madras, he subsequently proceeded to the North of India to investigate the cultivation and production of indigo at the Dalsingh Serai Research Laboratory. After two years thus spent, he returned to England and was sent by the India Office to continue his researches in conjunction with A. G. Perkin, F.R.S., at Leeds University. After three years in Leeds he returned to London, and was appointed Scientific Adviser to the Sulphate of Ammonia Committee. He died December 26, 1913, aged 53 years. (W. P. Bloxam's more important work on the indigo question is referred to in this J., 1901, 746; 1906, 735; 1908, 597; 1909, 516; 1910, 872.)

Journal and Patent Literature.

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d*. each, to the Comptroller of the Patent Office, W. Temple Franks, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s*. each, to the Secretary of the Society.

French.—1 fr. 05 c. each, as follows: Patents dated 1902 to 1907 inclusive, Belin et Cie., 56, Rue des Francs Bourgeois, Paris (3e.); Patents from 1908 to date, L'Imprimerie Nationale, 87, Rue Vieille du Temple, Paris.

German.—1 mark each with full particulars) to Kaiserlich Patentamt, Berlin, Germany.

Patents.

Superheating steam. P. St. G. Kirke and Bonecourt Surface Combustion, Ltd., London. Eng. Pat. 25,054, Nov. 1, 1912.

Steam generated by boilers such as described in Eng. Pats. 4362, 11,865, and 17,560 of 1910, 2404 of 1911, and 5936 of 1912 (this J., 1911, 406, 731; 1912, 110) which utilise the intense combustion of a mixture of fuel and air in contact with incandescent porous refractory material as described in Eng. Pats. 25,808 and 29,430 of 1909 (this J., 1910, 1448), is superheated by passing it through U-tubes or the equivalent introduced into the end portions of the boiler tubes.—H. H.

Evaporating liquids; Rotary dryers for ——. H. B. P. Humphries and J. B. Donald, London. Eng. Pat. 28,902, Dec. 16, 1912.

The liquid (tanning extracts, milk, calcium acetate solution, etc.) is led to the inner surface of a hollow steam-jacketed drum which rotates about a horizontal axis and is open at the ends. A flange at each end of the drum retains the liquid. The solid residue is continuously removed by a scraper and conveyor which passes through one of the open ends. The drum may be enclosed in a casing for vacuum working.—A. T. L.

Evaporating pans or *surfaces for brine and the like.* R. Stein, Hanover, Germany. Eng. Pat. 9570, April 23, 1913.

Salt pans are coated with a layer 2 to 3 cm. thick of "Fama" asbestos composition, which is composed of magnesite, magnesium chloride, asbestos fibre, and substances such as talc or infusorial earth. This material is applied in the form of a paste and may be reinforced by embedding in it metal wire or gauze. The pans may be formed wholly of this material, a thickness of 3 cm. being used. The material provides a smooth surface which does not contaminate the salt or cause it to "burn."
—A. T. L.

Concentration, evaporation and incineration of liquids such as soda lyes, residual liquors and other solutions; Furnace for the continuous ——. F. Woleský and R. Voleský. Fr. Pat. 460,559, July 21, 1913. Under Int. Conv., Aug. 14, 1912.

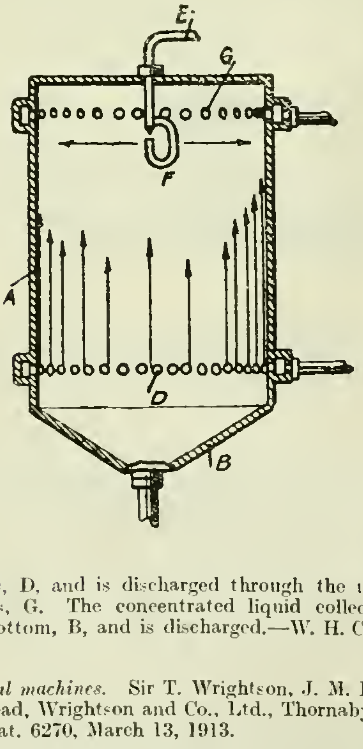
The apparatus consists of a tower at the sides of the base of which are suitable furnaces from which the hot gases pass upwards. At the top of the tower is a pan evaporator open above and having passages for the gas around and through it. Below are placed a series of superposed annular pans with radial extensions projecting inwards so that the gases pass upwards between the outside of the annulus and the tower and also up through the quadrant-shaped spaces between the radial extensions. Below each annular pan is a bridge or grating of refractory bricks or metal bars, crossed at right angles. The liquor from the pans overflows on to these gratings and is further concentrated. The liquid is fed into the top pan, and after undergoing a preliminary concentration there, flows into a vertical pipe which passes down outside of the tower and from which it flows by valve-controlled branches which pass through the tower to the centre of each annular pan.
—W. H. C.

Desiccation of liquids and other analogous substances; Process and apparatus for the ——. M. Töpler. Fr. Pat. 460,992, July 31, 1913. Under Int. Conv., May 6, June 10 and 20, 1913.

The liquid is projected by a current of compressed air in a horizontal direction and in a very fine state of division into a chamber so that each particle of atomised liquid remains separate and follows the path of its trajectory to the bottom of the chamber. Jets of air or other drying medium are delivered both above and below the stream of atomised particles either at an angle to or parallel with the stream, so that each particle remains surrounded by the drying medium during the whole time of its fall and is thus very rapidly converted into a dry powder at a low temperature, below 40° C. The dried powder is removed by a travelling belt placed a short distance above the floor of the chamber. The outlets for the moisture-laden air are in the side of the chamber below the belt. During the process the particles may be subjected to the action of ultra-violet rays or treated in other ways to effect sterilisation or chemical change.—W. H. C.

Evaporation and concentration of solutions and effecting chemical reactions; Apparatus for ——. G. A. Krause. Fr. Pat. 460,895, July 30, 1913. Under Int. Conv., July 31, 1912.

The liquid is fed into the vessel, A, through the atomiser, E, F, and is evaporated by a current of hot air or other suitable medium which enters through the lower ring of orifices, D, and is discharged through the upper ring of orifices, G. The concentrated liquid collects in the conical bottom, B, and is discharged.—W. H. C.



Centrifugal machines. Sir T. Wrightson, J. M. Ringquist, and Head, Wrightson and Co., Ltd., Thornaby-on-Tees. Eng. Pat. 6270, March 13, 1913.

The material is slowly introduced into a concave vessel or trough having its concavity directed towards an axis about which it is revolved, the axes or longer edges of the trough or troughs being parallel to the axis of rotation. The material is led into the troughs through a stationary axial pipe connected to a number of radial pipes, and it enters either the top or bottom ends of the troughs. Within each trough works a slowly revolving scraper. When in operation the separated liquid overflows at the end of the trough opposite to the supply pipe, the edge of the end partition being somewhat below the general level of the edges of the trough, and is thrown by centrifugal force into an annular collecting channel. The separated solids are forced by the scrapers over the longer edges of the troughs and discharged by centrifugal force into a surrounding casing. In a modified form, the troughs are formed by an endless belt of porous material passing round rollers, the liquid in this case passing through the belt and the solid being discharged as soon as it is brought by the movement of the belt to the side remote from the axis of rotation.—H. H.

Inflammable liquids; Method of and apparatus for conveying —— by means of a neutral liquid. B. E. D. Kilburn, London. From Martini und Hüneke Maschinenbau-Akt.-Ges., Berlin. Eng. Pat. 22,400, Oct. 4, 1913.

Petrol, etc., is discharged from a tank by the admission thereto of water or other neutral liquid from an upper tank connected by a siphon with the petrol tank. The petrol supply pipe is surrounded by a safety jacket which is connected with the uppermost point of the siphon, so that in the event of breakage, air would be admitted to the siphon and further discharge of petrol prevented. The petrol discharge cock is connected with a three-way cock on the siphon, controlling a by-pass opening to the atmosphere, so that when the discharge cock is closed, the water at the bottom of the petrol tank is subjected to atmospheric pressure only.—H. H.

Storage or conveyance of [inflammable] liquids. Martini und Hüneke Maschinenbau-Akt.-Ges., Berlin. Eng. Pat. 22,515, Oct. 6, 1913. Under Int. Conv., Oct. 5, 1912.

In conveying an inflammable liquid under pressure through a pipe line, it is necessary to prevent the outflow of liquid in the event of the breakage of the pipe. The liquid is forced through the pipe by admitting water to the storage tank. The pipe is jacketed and the water flows through the whole length of the jacket before entering the tank. In the event of breakage, the supply of water is thus stopped. The water is led to the storage tank by a branch from the highest point of the jacket, so that after breakage there is no temporary flow due to hydrostatic pressure.—A. T. L.

Vacuum-dryers; Method of feeding material to or from ——. F. J. Stokes, Philadelphia, Pa. U.S. Pat. 1,080,602, Dec. 9, 1913.

The material is caused to pack against the inlet and outlet valves so as to form a seal when the valve is opened. —W. H. C.

Dryer; Rotary ——. L. F. Griswold and C. B. Smith, Cleveland, Ohio. U.S. Pat. 1,080,629, Dec. 9, 1913.

The material is fed from a shoot by means of a screw-conveyor through an eccentrically disposed hollow trunnion into a cylinder which is rotated eccentrically and obliquely within an outer chamber. Heated gases from a furnace are discharged into the front end of the chamber from below and pass along and enter the lower end of the rotating cylinder through a second eccentric hollow trunnion and are withdrawn by a fan through a branch on the feed shoot. The dried material is discharged into a receptacle at the lower rear end of the outer chamber. —W. H. C.

Dryer; Centrifugal ——. J. V. Kranebiel, Williamsville, N.Y. U.S. Pat. 1,080,700, Dec. 9, 1913.

A flexible strip of material is wound upon a vertical shaft and the articles to be dried are placed between the folds of the material. Means are provided for preventing the strip from unwinding, and the whole is rotated, the centrifugal force serving to drive the moisture out of the articles.—W. H. C.

Nodulising materials; Mechanism for ——. L. P. Ross, Standish, N.Y., Assignor to Northern Iron Co. U.S. Pat. 1,081,063, Dec. 9, 1913.

An inclined rotary furnace is fitted with separable sections provided with communicating water passages. The ends of different sections communicate through hollow rings fixed to the furnace, and water is supplied to the movable rings from stationary hollow rings within which the movable rings revolve.—T. St.

Smoke-separator. C. F. Holmes, Assignor to J. Friebis, Beaumont, Tex. U.S. Pat. 1,081,116, Dec. 9, 1913.

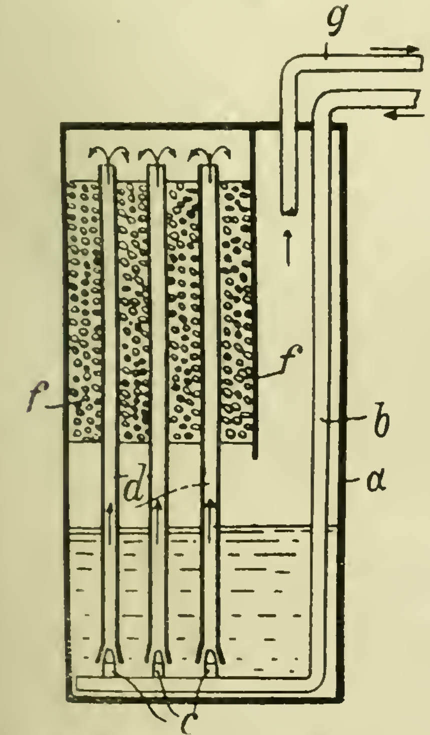
The smoke and gases from the apparatus are drawn through a flume by a suction fan situated at the end remote from the apparatus, and are discharged under water in a precipitating tank. Water is delivered in jets into the latter, whose contents can be discharged through a valve at the bottom into a settling tank. The flume is provided with a series of connected cooling coils arranged vertically and transversely, water being supplied to the coils at the outlet end of the flume. The bottom of the flume is provided with openings, and transverse, inclined, deflecting plates, and underneath are arranged soot-receiving receptacles.—T. St.

Separating suspended solids from liquids; Process and apparatus for ——. A. Jarraud. Fr. Pat. 460,170, July 9, 1913.

The mixture is placed in a series of filter vats in a chamber. Hertzian waves are caused to pass through the liquid from a set of wires stretched across the upper part of the chamber over the vats to a second set of wires stretched across the chamber below the vats and at the same time the chamber is cooled, whereby, it is stated, the finely divided solid particles become agglomerated so that they can subsequently be easily filtered off.—W. H. C.

Saturation, absorption, purification, decomposition and synthesis; Physico-chemical apparatus for ——. P. L. J. Mignet. Fr. Pat. 460,877, Oct. 15, 1912.

A casing, *a*, has an inlet tube, *b*, through which the gas or air enters under pressure and escapes through the nozzles, *c*. The gas or air passes up the tubes, *d*, which act as air lifts, carrying the liquid with it, and the mixture returns downwards through the annular channels, *f*, which are packed with suitable materials. The gas finally escapes through the tube, *g*.—W. H. C.



Separating mixed liquefied gases; Process of ——. A. C. Morrison, Chicago. Eng. Pat. 29,383, Dec. 20, 1912.

See U.S. Pat. 1,056,043 of 1913; this J., 1913, 426.—T.F.B.

Fractional distillation. M. A. Rosanoff, Worcester, Mass., U.S.A. Eng. Pat. 9654, April 23, 1912. Under Int. Conv., April 29, 1911.

See Fr. Pat. 443,054 of 1912; this J., 1912, 1020.—T.F.B.

Distilling apparatus. E. A. R. Chenard, Cognac, France. Eng. Pat. 15,625, July 7, 1913. Addition to Eng. Pat. 10,783 of 1913, dated May 7, 1912.

See Addition of July 8, 1912, to Fr. Pat. 443,499 of 1912; this J., 1913, 184.—T. F. B.

Separating liquids from separated solids; Process of recovering ——. F. I. du Pont, Assignor to E. I. du Pont de Nemours Powder Co., Wilmington. U.S. Pat. 1,081,949, Dec. 23, 1913.

See Eng. Pat. 17,602 of 1910; this J., 1911, 1037.—T.F.B.

Smoke from furnaces and the like; Apparatus for the treatment of ——. W. L. Thomas, Wheatley, Assignor to The Smoke Eliminator Synd., Ltd., London. U.S. Pat. 1,082,245, Dec. 23, 1913.

See Eng. Pat. 28,976 of 1910; this J., 1912, 216.—T. F.B.

IIa.—FUEL; GAS; MINERAL OILS AND WAXES.

Dunn pulverised coal burner; The ——. G. A. Rونsh. Metall. and Chem. Eng., 1914, 12, 19—20.

This burner was devised especially to ensure uniform feed of the powdered coal. Essentially it consists of a feed pipe through which the coal is conveyed from the storage bin, by means of a feed screw, to a perforated plate; the perforations in the plate and the rate of feed are so adjusted that the coal just reaches the end of the perforated plate. Immediately below this plate is the usual air nozzle. The mixture of coal dust and air is ignited by the heat radiated from the furnace walls. When used for firing cement kilns, only about two-thirds of the air, necessary for combustion, is supplied at the nozzle itself, the remainder being provided nearer the kiln from a pipe which passes through the hot clinker. The substitution of these burners for oil burners is said to have resulted in a saving of about 75 per cent. of the cost of fuel for calcining, whilst the capacity of the kiln was increased by about 25 per cent.—T. F. B.

Gas retorts; The corrosion of ——. Times Eng. Suppl., Jan. 7, 1914, 2. (See also Zinck, this J., 1913, 1000.)

Careful observations of the extent of corrosion are being made with the retorts in use at the Nechells gasworks of the Birmingham Corporation. Although most of the corrosion of the fireclay material of the retorts may be due to the presence of sodium chloride, it is the total soluble salts, and not necessarily the chlorides alone, which are responsible for the damage. Furthermore the simple presence of chlorides is not a true indication of the possible corrosive effect of the coal on the retorts. A number of coal analyses showed that the proportion of chlorides present might differ by over 100 per cent.; this may be due to imperfect washing of the coals at the collieries, or to the same washing water being used over and over again and gradually becoming more and more concentrated in soluble salts. Not only so far as the fireclay material is concerned is the presence of excessive quantities of chlorides undesirable, but recent experience with intermittent vertical retorts has shown that "pitching-up" in the hydraulic main may be partly attributed to the same compounds. An examination of the pitch so formed showed that the chief binding material was ammonium chloride. Arrangements were accordingly made to run both hot water and tar through the hydraulic main, the former taking up the chlorides before they could come into contact with the tar. In this way no trouble was experienced with the pitch for a period of six weeks, whereas formerly three days of freedom had been the limit. Removal of the ammonium chloride by washing in this manner introduces the possibility of being able to recover the ammonia of coal to a large extent as chloride instead of as sulphate, which at present is the common practice. In view of the relative values of the two substances, the recovery of ammonium chloride should be a profitable process, for the present prices are from £27 to £44 per ton, according to quality, whereas sulphate fluctuates in the neighbourhood of £13. As regards the chloride water drawn off from the hydraulic main, however, it is a question whether the removal of the various impurities, sulphocyanide, and traces of iron, and finally concentration and crystallization, might not be too costly.

Naphthalene problem: The —— in America. J. Gas Lighting, 1913, **124**, 950—952.

A Committee of the American Gas Institute submitted a number of questions to gas companies using all the different methods of making coal-gas, and obtained full replies in nine cases. The crude gas from vertical retorts and from chamber ovens contained comparatively little naphthalene. The tar from vertical retorts was practically free from naphthalene, the quantity present in the tar from chamber ovens was low, and in the tar from inclined and horizontal retorts, high. The production of naphthalene was increased by using light charges. Water-gas tar was used for extracting naphthalene in all cases, the quantity varying from 0·05 to 0·25 galls. per 1000 cb. ft. of gas. Water-gas tar itself was liable to contain much naphthalene if the superheater had been operated above 1380° F. (749° C.). In one case, the purified gas contained an average of 282 grains of naphthalene per 1000 cb. ft. without causing trouble in the distributing system. Stoppages were often cleared by the use of steam and gasoline, but a copious stream of boiling water or a heavy oil such as crude oil was preferable. It is suggested that in laying-out new plant, chamber ovens, vertical retorts, or long horizontal retorts should be adopted, the gas should be thoroughly cooled at the works, and cataract washer-coolers and a simple naphthalene washer should be used. When coal-gas is distributed alone and is not enriched, a cooling plant located at the outlet of the works, so that there is no further cooling in the mains, is suggested, in order to prevent crystallisation of naphthalene following upon the condensation of water from the gas.—A. T. L.

Oil fuel; The future of ——. B. Redwood. J. Roy. Soc. Arts, 1913, **62**, 103—116.

The world's output of petroleum has increased from 22,000,000 metric tons in 1901, to 46,500,000 metric tons in 1911, or from 2·8 to 4·3 per cent. of the world's output of coal. The principal sources of petroleum are shown in the following table :—

	Percentage of total output.		
	1910.	1911.	1912.
United States	63·52	63·30	63·25
Russia	21·82	19·45	19·37
Mexico	1·01	4·03	4·71
Rumania	3·07	3·32	3·70
Dutch East Indies	3·26	3·50	3·09
Galicia	4·00	3·15	2·43
India	1·84	1·83	2·03
Other countries	1·48	1·42	1·42

The demand is increasing more rapidly than the supply and the course of future developments depends upon the extent to which supplies can be increased, and also upon the manner in which the oil is used. The supply from Russia is likely to increase in 1914, and there are large areas still undeveloped. The supply from Mexico will become much more important, but it may be entirely absorbed by the increasing demand in the United States. There has been a very great increase in production in California, and this State is being rapidly transformed from an agricultural to a manufacturing country. Increased supplies may also be expected from the Dutch East Indies, Roumania, Peru, Alberta, Persia and Trinidad. Oil fuel is at present used as motor spirit, in place of coal for raising steam, and in Diesel and semi-Diesel engines. The increasing demand is most marked in the case of motor spirit, and methods of increasing the yield of petrol, of obtaining motor spirit from coal-tar and from shale oil, and the use of alcohol in place of petrol are discussed (compare this J., 1913, 819). The consumption of petroleum for naval purposes is rapidly increasing, the oil being used both for raising steam and for driving Diesel engines. All new warships for the U.S. Navy are designed for oil-fuel, and an area of about 100 sq. m. of oil-bearing lands in California has been set aside as a reserve supply. Large quantities of oil-fuel are used on locomotives on the Russian State Railways, and the advantages are such that oil would be largely used in this country if adequate supplies could be obtained at a moderate price. In view of the limited supplies, the principal development in the near future, apart from naval requirements, will be in the use of Diesel and semi-Diesel engines, since the high thermal efficiency of these engines makes it profitable to use oil fuel at a price which would be prohibitive for steam raising. If the market value of oil fuel becomes established on this basis, it will not be possible to use oil largely in place of coal for raising steam.—A. T. L.

Mineral oils: The constituents of high-boiling ——. J. Marcusson. Mitt. Kgl. Materialprüf., 1913, **31**, 301—318.

The author endeavours to answer by a process of elimination the question—which of the constituents of a mineral oil is responsible for the lubricating power. It is known already that the removal of cyclic and alicyclic unsaturated hydrocarbons by the formolite reaction increases the fluidity (this J., 1911, 842 and 1913, 589). The olefines hardly come into consideration as they are present in very small amounts in high-boiling oils: the best machine oils show always a low iodine value. Of the saturated hydrocarbons, which react neither with formaldehyde nor with iodine (paraffins and naphthenes), the paraffins may be eliminated as their fluidity and lubricating value is known to be low compared with the simplest naphthene. (The addition of solid paraffin to an oil lowers its value considerably.) The simple naphthenes occur mainly in the fractions below 300° C. in petroleum distillation, also a consideration of the elementary analysis of good machine oils, after removal of the bulk of the unsaturated bodies by the formolite reaction, shows that the residue must consist mainly of polynaphthenes. The high-boiling fractions of petroleum show a molecular weight of 300 to 400, and 350 corresponds to a polynaphthene containing 25 atoms of carbon. Such hydrocarbons must be the main cause of the lubricating power of a high-boiling oil. A similar process of elimination brings the author to the conclusion that the optical activity also of the high-boiling oils is due to the polynaphthenes.—J. B.

Petroleum oil and mineral wax; Analysis of ——. H. Kantorowicz. Chem.-Zeit., 1913, **37**, 1394—1396; 1438—1441; 1565—1567; 1594—1595.

Determination of asphaltum in mineral oil.—Asphaltum is insoluble in boiling ethyl acetate, whereas petroleum oil, paraffin wax and ceresin are readily soluble. Five grms. of the oil are boiled with reflux condenser for 15 minutes with 220 c.c. of ethyl acetate, the liquid filtered hot, and the residue boiled with successive portions (20 c.c.) of the solvent, until the washings (about 300 c.c.) are colourless. The residue of asphaltum is then dissolved in hot benzene, the solution evaporated in a weighed glass basin, and the residue weighed. The results are lower than those obtained by the alcohol-ether method, since the residue in that case consists of a mixture of asphaltum and ceresin. The amount of asphaltum insoluble in petroleum benzine ought also to be determined. As a rule American cylinder oils contain asphaltum insoluble in ethyl acetate, but not in benzine, whilst other oils (*e.g.* Roumanian, Russian) yield a large residue with benzine, but little with ethyl acetate. *Determination of ceresin and paraffin wax.*—Paraffin wax may be separated from petroleum oil, without preliminary distillation, by means of propyl acetate at a low temperature, the oil remaining in solution at −20° C. Five grms. of the petroleum residue (freed from petroleum spirit and light oils) are boiled for 15. mins. under a reflux condenser with 40 times the volume of ethyl acetate, and the asphaltum separated as described above, the filter being extracted with the solvent in Lehmann's apparatus. The filtrate, extract and washings are evaporated, the last traces of ethyl acetate removed in a current of air, and the residue dissolved in 40 c.c. of boiling propyl acetate. The solution is cooled to −20° C., filtered at −20° C. in Holde's apparatus and the residue washed with 80 c.c. of the solvent at the same temperature, after which it is dissolved in hot benzene, the solution evaporated, and the residue of paraffin wax and ceresin heated until constant in weight. With the exception of a trace of colouring matter it is pure. The results are invariably higher than those given by the alcohol-ether method after distillation, the difference (loss on distillation) being about 1·4 per cent. *Differentiation of natural and artificial vaseline.*—Artificial vaseline, prepared by mixing ceresin with vaseline oil, yields on treatment with propyl acetate a hard paraffin wax, which when repeatedly washed with boiling alcohol, becomes harder, quite solid and colourless, through the removal of waxes of lower m. pt. Natural vaseline, however, leaves a yellow residue, from which boiling alcohol dissolves a solid white wax, leaving a viscid yellow substance melting below 0° C. *Examination of bitumen.*—Separation of asphaltum by treating the bitumen with a mixture of benzene and petroleum benzine is incomplete, but quantitative results may be obtained by extracting the sample for several days with ethyl acetate. This dissolves the oil and resinous constituents, and on extracting the residue with benzene, hard asphaltum is dissolved and inorganic constituents are left. For example, 52 per cent. of hard asphaltum was thus separated from a natural asphaltum, whilst a petroleum pitch yielded 20 per cent. *Examination of ceresin and ozokerite.*—For the precipitation of ceresin 1 grm. of the sample is dissolved (beneath a reflux condenser) in 100 c.c. of boiling propyl acetate, and the solution cooled to 30° C. and kept at that temperature for 10 mins., after which the mass is rapidly filtered and pressed with a spatula. The residue is dissolved in boiling benzene, the solution evaporated, and the residue of ceresin dried for 10 minutes at 105° C., weighed and its m. pt. determined (capillary tube method). The m. pt. of the dissolved paraffin wax is also determined fter drying for 10 mins. at 105° C. Crude ozokerite is reed from asphaltum by extraction with ethyl acetate n Lehmann's apparatus, the extract evaporated, and the eresin determined in the residue by treatment with ropyl acetate as described. *Oxidisability of mineral oils.*—The usual tests as to the formation of tar, resinification, tc., are made in comparison with the determination of the ecrease in weight on heating, and determination of the sphaltum both by the petroleum benzine and ethyl acetate ethods. The loss in weight is conveniently determined a closed apparatus with an outer chamber in which a itable liquid may be heated, whilst a weighed quantity of e oil (50 to 60 grms.) is placed in a glass dish in an inner hamber, with an inlet and outlet for a current of air or ert gas. For testing machine oils the sample is heated for hours at 218° C. and for 8½ hours at 133° to 135° C., whilst linder oils are heated for 8 hours at 218° C. The lower mperature is obtained by charging the outer chamber th xylene or a suitable petroleum fraction, whilst phthalene is suitable for obtaining the higher temrature.—C. A. M.

phthenic acids and sodium naphthenate. J. Davidsohn. Z. angew. Chem., 1914, 27, 2—4.

E mean molecular weight of naphthenic acids is almost same as that of the fatty acids of cocoanut oil and m-kernel oil. Like the latter acids, a portion of phthenic acids is volatile in steam; the acids so volatid have a mean mol. wt. of 213·7, corresponding to an d value of 262. Compared with other sodium soaps, oanut and palm-kernel oil soaps require large quantities salt for their separation from solutions; the sodium p from naphthenic acid requires even more salt, comparative figures being: cocoanut oil soap, 13·1; palm-kernel oil soap, 10·9; naphthenic acid soap, 20·9. Sodium naphthenate also resembles cocoanut and palm-kernel oil soaps in its high lathering power and its low hydrolytic dissociation; these properties would indicate its suitability for many purposes, especially in the textile industry, such as for silk boiling, where a soap with a mild action is required.—T. F. B.

Use of pulverised coal in metallurgical furnaces. Lord. *See* X.

Patents.

Screening or grading and conveying coal, coke, and other materials; Method of and means for ——. R. S. Benson, Middleton St. George, Durham, and Head, Wrightson and Co., Ltd., Thornaby-on-Tees, Yorks. Eng. Pat. 28,115, Dec. 5, 1912.

The material is fed on to a perforated tray hinged at the discharge end to a conveyor trough reciprocating beneath it, and connected at the supply end with the trough by a bell crank lever adapted to impart a vertically reciprocating movement in addition to the horizontal one. Or, the trough may be perforated and arranged above the tray, which in this case is attached by bell crank levers at both ends; the smaller pieces fall through on to the tray where they are subjected to a further screening action.—H. H.

Coal-washing plant. R. Thomson, Hamilton, Lanarkshire. Eng. Pat. 4451, Feb. 21, 1913.

The sediment from coal-washing liquors is removed from the settling tank by means of dredger buckets while the liquid is pumped on to a filter bed having a vacuum chamber beneath. The invention is analogous to that described in Eng. Pat. 28,548 of 1911 (this J., 1912, 1114).—H. H.

Briquette fuel; Artificial ——. E. Eaton, London. Eng. Pat. 7643, April 1, 1913.

Briquettes made according to Eng. Pat. 6981 of 1912 (this J., 1913, 187) are formed from the following mixture, viz.: 60 lb. of ground chalk damped with 3 lb. of crude oil or petroleum, 30 lb. of small coal or ground peat or coke, and 10 lb. of solidified tar.—H. H.

Briquettes; Manufacture of —— *from coke dust, alone or mixed with wood waste.* J. Alexander. Fr. Pat. 461,065, Aug. 2, 1913.

To ensure the removal of all air from the pores of the coke, a very fluid tar is used as binder, and the mass is briquetted under a pressure of 100 atmospheres. A suitable material is the tar obtained in making gas from oil, and the soot deposited in the oil-gas retorts and in the pipes may be added with the tar. The absence of air from the pores of the briquettes enables them to burn without disintegration.—A. T. L.

Coke oven heated by blast-furnace gas or producer gas; Regenerative ——. Soc. Générale de Fours à Coke, Systèmes Lecocq. Fr. Pat. 460,399, July 15, 1913. Under Int. Conv., Sept. 4, 1912.

In order to ensure the distribution of air and gas in a simple manner, and to permit of the independent control of air and gas to each combustion chamber, four sole flues arranged beneath each oven chamber are connected in pairs with the regenerators so that two serve for air and two for gas, whilst the four flues beneath the adjacent oven chamber serve for the passage of the combustion products. The regenerators are arranged beneath the oven in the manner described in Fr. Pat. 457,674 (this J., 1913, 1000), alternate regenerators serving for air and gas. Each regenerator is connected by one conduit with two of the sole flues, and separate dampers are provided for regulating the openings from this conduit to each of the sole flues.—A. T. L.

[Vertical retort] oven for production of gas and coke. H. Koppers. Fr. Pat. 460,517, July 18, 1913. Under Int. Conv., July 30, 1912 and June 18, 1913.

The vertical retorts are surrounded by horizontal heating flues, and horizontal regenerators are arranged at opposite sides of the group of retorts, or, in another construction, all at one side. The heating gases enter and leave the horizontal flues by way of chambers extending through the whole height of the oven, and horizontal dampers are provided so that the regenerators may be divided into separate superposed compartments which are regulated independently in order to obtain the desired zones of different temperatures.— A. T. L.

Combustible gas from liquid fuel; Generation of ——. C. D. McCourt, Streatham Common, Surrey, and Radiant-Heating, Ltd., London. In part from C. E. Lucke, New York. Eng. Pats. 19,909, Aug. 31, 1912, and 5005, Feb. 27, 1913.

A spray of liquid fuel is introduced into a chamber containing a mass of refractory material where it commingles with highly heated inert gases flowing from a furnace burning a mixture of fuel and air or oxygen in the proportions for complete combustion as described in Eng. Pat. 29,430 of 1909 (this J., 1910, 1448). The combustion of the fuel for supplying the hot gases may take place either in the same chamber as that in which the fuel is vaporised, or separate intercommunicating chambers in close proximity to one another may be employed. The fuel spray may come into contact with the hot gases and be partially vaporised and decomposed thereby before entering the mass of porous material.—H. H.

Gas producers. A. Franks and G. Sanders, Dagenham, Essex. Eng. Pat. 28,936, Dec. 16, 1912.

The fuel is distributed towards the walls of the producer by a cone centrally situated beneath the hopper, and the gases are drawn off from the hollow space which forms in the body of fuel beneath the cone. The steam and air enter through annular grate bars completely surrounding the lower portion of the producer, so that combustion occurs uniformly from the lower circumference up through the central portions of the fuel, while a ring of unburnt fuel surrounds the burning mass in the middle and upper sections of the producer. The producer is open at the bottom, the contents being supported by the ashes resting upon the floor of the water-seal.—H. H.

Oil fired furnaces and oil-gas producers. W. M. and M. M. Burdon, Bellshill, Lanarkshire. Eng. Pat. 1767, Jan. 22, 1913.

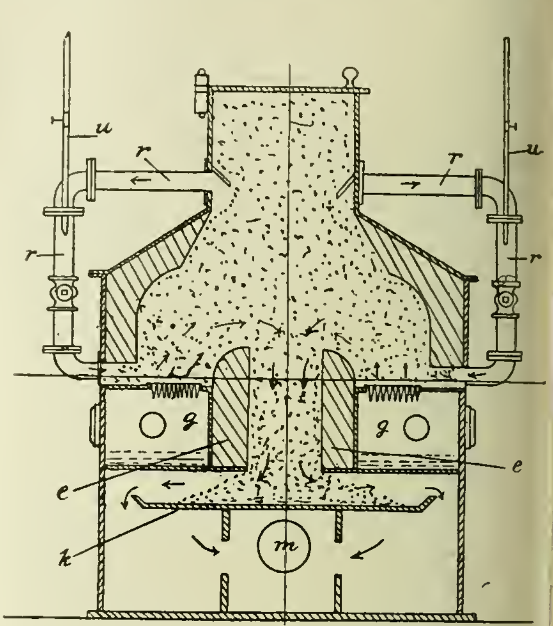
The invention is a development of that described in Eng. Pats. 27,348 and 29,522 of 1910, and 14,657 of 1911, and consists in heating furnaces, etc., by causing air in a state of gyration to mix with heated oil and then flow through a heated vaporising retort direct into the furnace or chamber to be heated. The gyrating air impinges against a jet of oil at the outer end of the vaporising retort so as to produce a spray which is carried forward in a spiral path through the retort. A portion of the waste gases from the furnace, etc., is utilised for heating the oil and the retort.—H. H.

Gas producer for raw fuels. E. Ragot and P. P. Hervotte. Fr. Pat. 461,081, Aug. 4, 1913.

A vertical metal retort, open at its upper, wider end, is arranged in the lower part of the producer chamber, and is connected at its lower end with a horizontal cylindrical gas outlet chamber beneath the hearth of the producer. Air is admitted at the bottom of the fuel column in the producer, and producer gas is made by the upward passage of the air through the fuel in the annular space around the retort. The fresh fuel above the level of the top of the retort is partially coked, and that portion of the fuel which descends through the retort is coked completely.—A. T. L.

Gas producers. S. F. Home, Dublin. Eng. Pat. 1783, Jan. 22, 1913.

The producer is rectangular in form and has two walls, *e*, passing through it from side to side. The air is introduced into vaporising chambers, *g*, formed between the walls, *e*, and the outer casing, and passes first in a vertical, then in a horizontal, and finally in a downward direction through the central portion of the fuel. The tar, etc., evolved from the upper portion of the fuel is led back into the combustion zone through pipes, *r*, containing injectors, *u*, for accelerating the flow, these being operated by exhaust engine gases or the like. The ashes pass from the deflector, *k*, into a liquid seal chamber, while the gas generated is drawn off through an outlet, *m*. The apparatus is intended more particularly for use with bituminous fuels, peat, sawdust, waste wood or other fuels giving large quantities of hydrocarbon gases.—H. H.



Gas; Method of and apparatus for washing and cooling ——. E. F. Lloyd, Detroit, Mich. U.S. Pat. 1,081,455. Dec. 16, 1913.

The gas and the washing liquor, which is at a lowe temperature, pass in opposite directions through a scrubbe provided with suitable baffles for removing the impuritie from the gas, the liquor from the bottom of the scrubbe being separated from the solid impurities and passe together with and in the same direction as the washe gas through a cooler.—A. T. L.

Mineral oils and similar products; Process and apparatu for the distillation of ——. K. Kubierschky. Fr. Pat 460,156, July 8, 1913.

In distilling crude oil by the introduction of superheate steam, any steam not condensed with the oil vapours bein returned to the superheater and passed again through th still, it is proposed, in order to prevent the accumulatio of light oils in the vapours, to withdraw a part of the stea and add fresh steam on the way to the superheater. Th steam which is withdrawn contains light oil vapours an is passed through a rectifying column and dephlegmat in which it meets the crude oil and serves to separa therefrom the products of low boiling point, so that t superheated steam in the distillation column meets on an oil distilling above 100° C. Preferably, the crude is heated first in the dephlegmator and then in a tubul heater through which passes the residues from the di tillation column. The oil then enters the rectifyi column, and after meeting the vapours as described, serves as cooling liquid for the vapours coming direct from the distillation column, whereby it is further heated. The oil is next passed through a second tubular heater, heated by the residues from the distillation column, and is finally admitted at 170° C. to the top of this column, meeting superheated steam at 400° C. which is admitted at the base of the column.—A. T. L.

Peat, turf, and the like ; Process for removing water from ——. A. Browne, London. From P. Roth, Berlin. Eng. Pat. 28,834, Dec. 14, 1912.

See Fr. Pat. 451,864 of 1912 ; this J., 1913, 690.—T. F. B.

Fuel mixture. G. E. Heyl and T. T. Baker, London. U.S. Pat. 1,081,739, Dec. 16, 1913.

See Eng. Pat. 4570 of 1913 ; this J., 1913, 903.—T. F. B.

Petroleum or other hydrocarbon oils ; Process of treating ——. S. Wohle, Assignor to The Wohle Mineral Oil Products (1910), Ltd., London. U.S. Pat. 1,081,801, Dec. 16, 1913.

See Fr. Pat. 414,928 of 1910 ; this J., 1910, 1293.—T. F. B.

IIb.—DESTRUCTIVE DISTILLATION ; HEATING ; LIGHTING.

Incandescence mantles, rare earths and their radio-active by-products. E. Stern. Z. angew. Chem., 1913, **26**, 806—815.

Incandescence mantles are composed of 97—99 per cent. of thorium oxide, 0·8—2·8 per cent. of cerium oxide and a few tenths of a per cent. of beryllium and aluminium oxides. The higher proportion of ceria is used for mantles for high-pressure gas burners. The traces of other oxides mentioned impart strength by producing a partial sintering of the deposit. The mechanical distribution of the deposit, or surface development, is determined by the textile thread employed. Cotton, with short but fine fibres, gives a very porous but weak mantle, liable also to distortions due to sintering: ramie is much longer and coarser and gives a strong mantle with sufficiently developed surface more stable in the flame ; the continuous filament of artificial silk imparts great elasticity, and its coarseness gives stability of form without impairing luminosity. The ash content of the textile yarn must be very low (0·02—0·03 per cent.). The mantle industry consumes 300 tons of thorium nitrate per annum, representing about 3300 tons of monazite sand. The by-products include over 1000 tons of cerium oxide, of which only 3 tons are required by the mantle industry. A ton of sand, costing £30, contains 2·5 mgrms. of radio-active mesothorium of which 2 mgrms. (value £30) are recoverable. Thus 6 grms. of mesothorium are available as a by-product, but much larger quantities are likely o be required for therapeutic purposes. Since the mantle industry cannot absorb more thorium, the extraction of arger quantities of mesothorium depends on the profitable tilisation of the cerium. Of the 1000 tons of cerium xide now procured, 200 tons are employed for the manuacture of sparking alloys for cigar lighters, etc. The erium is obtained by electrolysis of the fused chloride. further 300 tons are used in the form of the fluoride for mpregnating arc-light carbons. It is suggested that a conderable outlet for cerium compounds might be found the weighting of silk. The dyeing and photographic dustries take small quantities of cerium salts. In commercial mesothorium, 25 per cent. of the radioactivity is due to radium which cannot be separated. Weight for weight, mesothorium is 300 times more active than radium, but it breaks down in a much shorter time. One of its most useful products is thorium X which is 200,000 times more active than radium and can be obtained in the form of solutions of any desired strength. The γ-rays of mesothorium are distinguished by a very high penetrating power.—J. F. B.

Patents.

Heating of fluids. C. D. McCourt and Radiant-Heating, Ltd., London. Eng. Pat. 22,305, Oct. 1, 1912.

In heating fluids by means of "surface combustion" as described in Eng. Pats. 25,808 and 29,430 of 1909, 4362, 11,865, and 17,650 of 1910, 625 and 2404 of 1911, 5936 and 19,490 of 1912 (this J., 1910, 1448 ; 1911, 406, 731, 1070 ; 1912, 110, 178 ; and 1913, 936), hot gases formed by "surface combustion" are passed through a body of refractory material, or combustible gases are burned therein by "surface combustion," and the fluid to be heated is forced through another body of refractory material which is arranged so as to be heated by the former. For example, either body of refractory material may envelop the other, and one of them may consist of a serpentine pipe packed with a suitable material.—A. T. L.

Cobalt filament for electric [incandescence] lamps ; Manufacture of ——. K. Tanimura. Fr. Pat. 460,093, July 7, 1913. Under Int. Conv., July 17, 1912.
